Description

Versafile is an easy to use, sentence-oriented data storage program. Getting information in and out of the system is as easy as typing a sentence — the computer does all the work!

Format

The program is supplied with a program diskette, one blank data diskette and manual in a deluxe three-ring binder.

Minimum Hardware Requirement

- 16K Level II TRS-80 Computer System
- Expansion Interface
- One TRS-80 Model I Disk Drive
- Optional Printer

Detailed Description

System features include:
- Insertion of new information
- Searches based on single or multiple words
- Single and multiple item kills
- Global search
- List contents of one or all files

As a sentence oriented data storage program, Versafile offers you tremendous flexibility. You enter information in simple sentence form:

Mary has a blue 1970 automobile.
Jack was born in a blue house.

The computer stores information in one of seven disk files based on a KEY WORD. In the above examples, HAS and WAS are the key words. To retrieve information simply ask a question:

Who has something blue?

The computer will respond with:

Mary has a blue automobile.

We would have gotten this same information if we had asked about 1970, automobile, or Mary. A question like 'What is blue?' might yield:

Mary has a blue automobile.
Jack was born in a blue house.

Up to seven different files may be opened by the program. Six of these files will contain sentences with one key word, the seventh file will contain all sentences which did not fit the first six. You can use the key words provided, or change them to meet your special needs.

Once statements are in the files, you can recall any of them by simply by typing a question about what you want to know. If the information is not in the specific keyword file, the computer will search other files for information which may fit your question.
