The Blurb by Roy Soltoff

TMQ's NEW look

Our cover tells it all. This is the first issue where we are printing it via our relatively new laser printer, the NEC LC-890. Actually, the LC-890 is not a *laser* printer per se; it is a *LED array* printer. But most folks do not know the difference between lasers and LED Arrays; they lump both laser and LED array printers into the same category. Last year's *PC Magazine's* issue on "printers" shed some light on the differences; I commend that to your attention if you are interested in the topic.

We are extremely pleased with the quality and flexibility of this printer - not to mention the speed. Where it used to take a full day to print off the 100-odd pages of an issue of TMQ, this printer can produce the camera ready quality originals in about 10-12 minutes. Not only that, Brenda usually had to spend about a day pasting up the headlining previously generated on our Merlin lettering machine. The only thing we need to do now is paste on any advertising we are putting into an issue. Hopefully this year, the acquisition of a scanner will alleviate that requirement.

Since this issue is the first using these new facilities, let me spend a little time to discuss what I did, and why. I kept the original style of a 2-column format because I believe that it is more readable than single column; three column is out of the question. The main text is printed using a 10-point Times Roman font. Titles were "set" in 18 point italic. I chose Times Roman because it is the most compressed of the serif fonts at our disposal. Previous *Quarterlies* were printed on our Daisy-wheel with a Prestige Elite 12 typewheel, which is 10 point. I also had the originals shot at 90%; thus, the end result was about a 9-point font. This TMQ is printed for 100% reproduction; left and right margins (including jog for binding) as well as headers and footers were printed on our machine as they will be photographed for offset printing. According to the experts, a proportional font is always more readable than a fixed-pitch font (like Courier, for instance, or previous *Quarterlies*). I feel the Times-Roman font is quite readable.

The headers and footers are printed in a Bookman type face of both 12 and 14 point ("**THE MISOSYS QUARTERLY**" being 14-pt). Bookman characters are a little "wider" than Times-Roman; have a slightly different "look" to them, and I wanted something to set off the name of the publication. Personally, I doubt that "wider" is the term which the experts would apply, but you get the idea. Note that I used a special type face from our Merlin lettering machine for the publication name in previous issues. That happened to be "Eurostile/Microgramma Bold Extended". The chapter lead-ins (that which is in the large box) are printed in 24-point Helvetica Italic. The box is directly composed by Microsoft WORD which was used to prepare the entire *Quarterly*. I thoroughly agree with the experts that you should not mix too many different type faces on a page; thus, I limited the composition to Times-Roman, special effects in Helvetica, headers in Bookman.

Where I needed to display a program listing, I chose to use a Courier font which has a fixed pitch character set. That is "typewriter style" and is what most folks would expect. Usually such listings were printed in an 8-point font. This may not be suitable for some folks, but we believe that it is readable. Also, we really don't expect too many folks to be typing in long programs from these listings but rather to obtain the files on disk as part of DISK NOTES.

I would be most interested in reading your comments concerning the new look of TMQ. Since this publication is primarily for its readers, your opinions will weigh heavily on the appearance of future issues.

Ramblings

If you have a strong interest in understanding the implications of various disk allocation methods, you ought to read the article by Gregg Weissman which appeared in *BYTE 1987 Extra Edition, Inside the IBM PCs*. One of the things most users never knew about the version 3 release of MS-DOS was that the method of allocating disk space was changed. As stated in the article, "Previous versions of DOS use a *first-fit* algorithm. Every time a new file is created or an existing file is extended, DOS starts looking for unused space at the beginning of the disk's FAT (file allocation table), scanning forward until it finds a free cluster (the minimum unit of disk space that can be allocated). Version 3.0 and higher use the *next-fit* algorithm, in which DOS begins looking for a free cluster at the point where it last left off searching in the FAT."

Without attempting to excerpt the "meat" of the article, suffice it to say that the conclusion reached was that the efficiencies gained by using the *next-fit* algorithm were so outstanding, that hard disk users should upgrade to DOS 3.0 or higher. Note that the discussions presented in that article provide a rationale for a re-analysis of the disk allocation changes introduced into release 6.1 TRSDOS and patched changes to release 5.1.4 LDOS and carried forward to the current releases of those two operating systems. If one would expect that more releases would be considered, that would be justification for such efforts. Food for thought...

Turning to another front, I thought it interesting to note the following reprinted from an article in *DM News* of October 1, 1987.

"Compaq has a circulation of 100,000, 60 percent of which are subscribers. The publisher has the cooperation and support of the makers of the Compaq computer. A free, one-year subscription card is attached to warranty cards included with the hardware. Compaq created the last direct mail *Compaq* magazine subscription brochure, dropping 200,000 mail pieces for Redgate, at no cost to the publisher, according to Sandy Van Salisbury, Redgate client services officer."

Now I just wonder where Tandy would be today if they provided this kind of support to *80 Microcomputing* back in the "old" days. More food for thought...

Here's a new listing I thought appropriate for TMQ; it's the MISOSYS hot list of products. This list represents what products in our catalogs have been the most popular in terms of sales units. The list excludes TMQ subscriptions and DISK NOTES. Let me know if you find this useful. We may want to explore another list based on dollar volume. Gee, once you computerize your invoicing system, all kinds of summaries can be easily obtained. The current month is January 1988; prior 3 months is Oct-Dec 1987; and prior 12 months is Jan-Dec 1987.

MISOSYS HOT List

<u>Current Month</u>	<u>Prior 3 months</u>	<u>Prior 12 months</u>
LDOS 5.3	LDOS 5.3	LDOS 5.3
RSHARD	PRO-WAM	PRO-WAM

Here's some news for those folks looking for news on their TRS-80 computers. A new bi-monthly has commenced publishing in an attempt to fill the void left by *80 Microcomputing's* desertion. It is called *Computer News 80*. Contact the publisher at P.O. Box 680, Casper WY 82602-0680 or telephone 307-265-6483.

Let me close up this rambling session with some observations. January was one of the worst months I have ever experienced since starting this business ten years ago. Never have I had to put up with so many folks who absolutely had no knowledge of their computer system, had no idea who was/is responsible for their installation, hadn't the foggiest notion as to the use or concept of basic system commands like COPY, DIR, and LIST, not to mention FREE and DEVICE, and plain out refused to read even the first paragraph of provided documentation which referenced a README/TXT file and how to read it. Of course I'm talking about the bulk of the folks calling about upgrading their DOS.

A good part of the frustration involved some simple concepts. Tandy never contacted MISOSYS in any way prior to issuing information to their Customer Support organization or their stores concerning the DOS upgrades. My company was

inundated with calls during the early part of January. These calls were directed to our 800 order line. Apparently because Tandy's message was not clear, at least half of the calls were from folks needing an upgrade to TRSDOS 6.2. Another third were calls from their store personnel seeking information. Still another group were requests for support on Deskmate, Profile, and other Tandy products.

At first we tried to be nice and re-directed the TRSDOS 6.2 misdirected folks to LSI by providing LSI's phone number to the caller. I soon became furious that we were unable to get any of our work done just in dealing with those calls, not to mention that they were to our 800 number and MISOSYS was paying for the calls!

Even the calls which were correctly directed to us for the LDOS upgrade presented more problems than what they were worth. A little background is in order. A number of years ago, Logical Systems Inc licensed to Tandy Corporation, a 5.1.3 version of LDOS with support of the Tandy 5 Megabyte hard disk drive. This product was sold by Tandy as the *Hard Disk Operating System*. It was later upgraded to a 5.1.4 release and the hard disk driver was revised to support Tandy hard drives up to 15 Megabytes. The HDOS product was totally manufactured by Tandy; LSI received a small royalty per unit in the neighborhood of \$3-5.

It is folks who owned HDOS and were complaining to Tandy about the lack of 1988 support who were referred by Tandy to MISOSYS. These folks never were our customers, nor are we able to provide them an upgraded copy of HDOS. As far as MISOSYS is concerned, we sell only a floppy-version of LDOS 5.3; existing users have to add their existing hard disk interface (driver). Our installation instructions are intended for reasonably knowledgeable users. In a lot of the HDOS cases, those folks never installed their system themselves; Tandy did. They knew nothing about their "installation", knew nothing about their system configuration, and expected us to give them step by step details on how to "upgrade" their hard disk system. As most of our knowledgeable readers know, it is practically impossible for anyone to ascertain over the phone in a reasonable period of time how someone else's system is configured, yet these folks were insisting we do just that! We were exposed to these folks repeatedly calling our 800 line, attempting to tie us up for 15-30 minutes to explain procedures, etc. When you sell a product for \$35, that level of support just can't get provided. Besides, we were asked to support their hard disk driver which was not our product nor was it a product we acquired from Logical Systems!

As far as I am concerned, if I had to do it over again, I would never have provided updates to HDOS customers. I would have required submission of a proper LDOS 5.1.4 master disk before updating and would have expected Tandy to negotiate the provision of upgrades to their HDOS customers. Well all of that is water over the dam. The entire mess forced us to impose a new policy concerning LDOS upgrades. This policy can be read in the section on LDOS in this issue of TMQ. We also came close to (1) getting our 800 line disconnected, and (2) eliminating our presence from the software marketplace. At this point, I am not satisfied that this really is the best business to be involved with. Suffice it to say that the excellent feedback we receive from most of *our* customers tends to

make it worthwhile. It's always the 10% that irresponsibly take the greater part of our time; that to me just isn't fair.

TMQ Schedule

Just the other day, we received a call from a TMQ subscriber claiming non-receipt of his Fall 1987 issue (II.ii). This is the issue we mailed right before Thanksgiving. Now I can understand how mail can get lost; I can also understand that we could have had a problem here. But I cannot understand such a long delay between our normal schedule for mailing and complaint of non-receipt. Have we been that bad in adhering to our schedule? Don't answer that.

Our target for mailing the *THE MISOSYS QUARTERLY* is the last week of the respective month as follows: Winter issue in February, Spring issue in May, Summer issue in August, and Fall issue in November. This schedule may place your TMQ late in the season based on the cover date; however, it follows from the mailing of Issue I.i on August 19th, 1986. We would like to pull up the mailing date about one month to place it in your hands closer to the first month of the season. But for now, the above periods are when it gets mailed. Please, if you have not received your issue by the last day of the following month, contact us. Also contact us with a revised address if you have moved - or are intending to move soon.

PD Software Librarian

A previous issue of *THE MISOSYS QUARTERLY* requested contributions of public domain software so that some central repository could be established. We have had only a few disks sent to us. We have also heard from a dedicated TRS-80 user who has offered to serve as the librarian for the collection of public domain diskettes. We are forwarding what we have to Vic and request that henceforth all requests and contributions be directed directly to him. The TRS-80 PD disk librarian is:

Vic McClung
914 Crescent
Sikeston, MO 63801
USA

LDOS Manual TABSETs

We have lots of tab sets for your LDOS manuals stored in boxes over at our warehouse. I recently bought 1000 of these 9-1/2 x 12-1/2 envelopes which the tab sets fit into and I want to give the tab sets away for free. Send us a mailing label with your address on it along with United States postage for 3 ounces (or equivalent in international reply coupons) and a set is yours. We will soon clean house and throw this stuff out. If you want a set, get your request in.

LDOS 5.1.4 Quick Reference Cards

We have thousands of them. They're not too useful any more since 5.3 was released, but if you want a FREE 5.1.4 QRC, send me a #10 envelope (or one at least 4 x 9) and 3 ounces of

United States postage (or equivalent in international reply coupons). Be sure to put your address on the envelope for your free QRC. We will soon clean house and throw this stuff out. If you want a set, get your request in.

LDOS Journals, Volume II

We still have many sets of the old *LDOS QUARTERLY/LSI JOURNAL*, Volume II (issues 1-6). A set goes for \$9.95 + \$3.50 S&H (US). We will soon clean house and throw this stuff out. If you want a set, get your request in.

THE SOURCE, 3-volume set

We still have a few hundred sets of the complete commented source code to TRSDOS 6.2 in book form excluding BASIC, hard disk support, and HELP facility. Our current catalog price is \$74.95 + \$5 S&H (anywhere, that's ground shipping only). Here's our final closeout price: **\$40 delivered**. We will soon clean house and throw this stuff out. If you want a set, get your request in. This offer is open to anyone; you do not have to be a TMQ subscriber. You can also buy as many sets as you want - until our supply is gone.

Notice of release 4.0 ED/ASM-86

I had hoped that I would be able to report that release 4.0 of ED/ASM-86 would be ready for shipping. Unfortunately, the extent of the changes introduced into the assembler package have delayed its introduction. I expect that it should be ready sometime in March. Anyone registered with a current release of ED/ASM-86 will get a free upgrade. Let me highlight some of the enhancements that Phil has incorporated into this integrated assembly language tool.

1. The most major new feature is the capability to output MSDOS standard .OBJ files. The new assembly option "-OB" accomplishes this. Such files must be linked by the MSDOS linker.
2. Monochrome mode is now supported, in the screen editor and elsewhere. If a monochrome card or equivalent thereof is installed, but is not the primary adaptor in use at the time of ED/ASM-86 invocation, you can re-direct the screen output to it with the /M command line option.
- 3) Pressing <F9> in the debugger mode includes 8087 register display; disassembled lines are displayed; the topmost stack contents are displayed. When executing or tracing a program, a highlighted bar will appear indicating the position of the next instruction to be executed. Labels in the current symbol table will be displayed where appropriate in the disassembled code. Stack activity and contents can be monitored by the stack display window.
4. It is now possible to dynamically monitor the contents of a given variable location with the debugger "WATCH:expression" command. More than one expression can be monitored.
5. Debug now supports the "TS" command. This allows CALLs and INTs to be skipped rather than being forced to trace through subroutines or interrupt procedures. You can now use the <F6> function key to continue a "TS" trace. Also, <F5> function key is identical to "T<return>".
6. The "L1" assembly option prints the current line being assembled in both first and second passes.
7. A new editor-mode command has been added. "RESET:file" resets the archive bit of a file.

8. A new feature accessible with "DO" batch files has been added to provide a simple "MAKE" capability which uses the archive bit.

9. The "WE" assembly option, which waits for user input when an assembly error is encountered, now allows an <E> to be pressed to immediately screen edit the offending line. If the line is an INCLUDE file, that file will be loaded. This increases the interactivity of the system.

10. The "?" in an assembly expression is now treated identically to "0"; this avoids errors when assembling files designed for MASM.

11. The "DET,B" editor instruction, which essentially clears the editor buffer, normally asks for verification if the buffer has not been saved to disk. This verification is now bypassed if "DET,B" is executed inside of a "DO" batch file.

12. It may be desirable to have a .EXE file load in high memory. This may be accomplished by using the assembler MAXSEGS pseudo-op. A parameter value of 0 instructs the DOS loader to load in high memory.

13. A semicolon, followed by any text, can be used in editor command mode to specify a comment. This is useful during execution of "DO" batch files.

14. You can invoke the COMMAND.COM MSDOS shell with the "DOS:command" editor mode command, if there is sufficient memory. You can change directories, erase files, invoke other programs, etc., then return to ED/ASM-86 with the MSDOS EXIT command.

15. To assemble the equivalent of a .EXE loaded program into memory, use the "-IM-EX" assembly options. All appropriate registers will be set up as it would with a normal .EXE load, including the start address for the debugger.

16. The PURGE pseudo-op is no longer supported.

17. The debugger "LDX:file", which loads an executable (.EXE) type file into memory, now assumes an extension of .EXE if no extension is given.

18. You may now use an asterisk (*) as the output file name in the "A:" command. This generates a filename using the current source filename and output type.

19. Several improvements have been made to the structured assembly language constructs. You may now use the boolean parameters "AND" and "OR" with any of the structured constructs.

20. Source files are no longer tokenized; thus, lower case source is preserved as well as acceptable.

21. A "repeat last assembly command" and a "repeat last DO command" have been added. This speeds the interaction of edit-assembly operations.

22. Finally, a MASM command line option is available to alter the behavior of certain ED/ASM-86 operations so as to conform to MASM's style. This includes acceptance of "B" vs "V" for indicating a binary data operand, and free-field entry of labels versus pseudo-ops.

Out of print TMQ's available

We are providing back issues of *THE MISOSYS QUARTERLY* via copier reprint. The price is \$10 plus \$2.50 S&H in the U.S. and CANADA. For foreign zone D, the S&H rate is \$3.75; zone E is \$5.00. That price will be in effect also for regular back issues. Back issues will be available ad infinitum through one means or another. That includes issue I.i, I.ii, and I.iii as well, which are currently out of print. Here's a synopsis of past issues:

I.i A cc for MC; Add SETEOF to EnhComp; Change baud rates with SETBAUD; unlock protected BASIC programs; WinCalc: a PRO-WAM application.

I.ii BANKER - RAM bank control; BINHEX revisited;; Expose on LDOS 5.3; Fractals in FORTRAN; Model 4P BOOT ROM exposed; Split REL libraries with SPLITLIB.

I.iii Extended Memory access for LS-DOS; Upgrading Little Brother to LS-DOS 6.3; Converting Mail File Data to LB; a "CAT" for LDOS, "KILL" for LS-DOS.

I.iv UNDATE reverses DATECONV; 80x86 assembly language; Converting LDOS filters to LS-DOS; Previewing output from SCRIPSIT; Learn MORSE with CODE/BAS.

II.i David Hall on the 64180; Gary Phillips on XLR8 & 4P; Doug Tittle on sorting PRO-WAM data; WORD with DW II.

II.ii Extended DATE\$ of Model I LDOS 5.1.4; Input SUBroutine for QuickBASIC; BASIC Interface to @EXMEM; HIRES Graphics for MC; Focus on speed.

DISK NOTES 2.3

Each issue of *THE MISOSYS QUARTERLY* contains program listings, patch listings, and other references to files we have placed on DISK NOTES. DISK NOTES 2.3 corresponds to this issue of TMQ. If you want to obtain all of the patches and all of the listings, you may conveniently purchase a copy of DISK NOTES.

DISK NOTES is priced at \$10 **Plus S&H**. The S&H charges are \$2 for US, Canada, and Mexico, \$3 elsewhere. If you purchase DISK NOTES with the coupon which accompanies this TMQ issue, you can save \$2.50; the cost then being only \$7.50 + S&H.

Family Update

Finally I get to the column which has inspired some extremism. I know that a few readers want me to drop this column; but it turns out that there are many more readers who look forward to this section. There are various degrees of family orientation in all of us. I'm happy to say that enough of you share my beliefs, and I am glad to read of your family's interests external (or internal) to computing.

As for us, we spent this past Christmas near Ashville, NC in a little town called Edneyville. Regular readers of this column know that Brenda's parents have a cabin in the mountains down there and this end of the year excursion has become an annual event. This year, it turned out a little different. Brenda's grandfather (her dad's father) passed away about a week before Christmas; he was in his 80's and was quite ill. Brenda flew down to Miami for the funeral and subsequently drove back up to NC with her folks. I, in turn, drove down to NC with Stacey and Stefanie. Brenda's parents thought I was brave to take on the 10+ hour drive with the kids without her; but I have never felt out of place taking my two girls on a trip (short or long) without their mom. Well, I think I did feel uncomfortable once when by myself, I took Stacey, who at the time was about age 2 months, to the supermarket. Actually, the trip south was about the most pleasant we have ever been on to NC. Perhaps that was because I took more frequent rest stops, and our dinner stop lasted for about two hours; the ice cream and cake dessert didn't hurt either.

Near the end of January, the flu bug hit here. Both Stacey and I were hit hard. I was really dragging one afternoon and decided to call it quits. After discovering that I had a 102.5 fever, I soon came to realize what was wrong; haven't had such a fever in years. This flu even caused MISOSYS to close for two days due to sickness; did you hear our recording? Stefanie picked up the bug as well. We were all hoping that Brenda would not succumb since she is unwilling to take any kind of medication during her pregnancy. As I write this, we're still crossing our fingers, but the most she's gotten is an occasional sniffle.

As for myself, I've gotten into a greater involvement with the community organization here where we live (and work). I'm on the Board of Directors and am the organization's Treasurer. We live in what we call a "planned community" which means that the developer has imposed a considerable level of constraints by recording a set of Covenants onto the deeds. We have a non-profit corporation to "run" the community, much akin to any small town, and each homeowner is a required member of the corporation; it's official name is *The Countryside Proprietary*. Our community encompasses approximately 2500 homes, has three swimming pools, tennis courts, basketball courts, covers about 1200+ acres with about half open space, soccer fields, exercise trails, etc. The primary function of the Proprietary is to maintain all of the common facilities, and ensure architectural control of exterior changes to all homes. It's a big job, but a valuable one. We actually have an annual budget which exceeds that of most towns in our County. But I love the involvement as well

as the excitement which comes from knowing what's happening around you. The important thing for me is to ensure that I still maintain a healthy amount of family participation.

Let's now turn to Brenda. She's certainly handling the pregnancy much better than the first few months. Brenda is still driving the school bus (van) for the pre-school where both Stacey and Stefanie go, and she hopes that she can continue that job until the end of school (somewhere about the end of May). The new baby is expected in early June. We are scheduled for a sonogram (well, I'll be there but it will only be performed on Brenda) the first part of next month. Then we hope to get a good "picture" of the baby's growth and possibly determine the sex. We were inclined to not know that bit of information for the first two, but it appears more of interest for this baby - our last. We'll let you know what turns up.

In early January, we took Stacey and Stefanie up to the Baltimore Museum of Art to see the Dr Seuss exhibit. Now I thought that I never grew up with Dr. Seuss; however, when I learned that he was the original author of *And to think that it happened on Mulberry Street*, as well as all of the "*Quick man, the fliit*" advertising which I recollect from my youth, it turns out that Dr. Seuss was a part of my "culture". Of course, Stacey and Stefanie have practically the entire set of Seuss books: *Green Eggs and Ham*, *There's a Wocket in my Pocket*, and of course the infamous *Cat in the Hat*, along with dozens of others!

We also have been getting together a good collection of children's videos from cable TV - the Disney channel. Kudos to our friends down under in Australia for providing such interesting stories which merge animation and real-life activities such as, *Dot and the Bunny*, *Dot and the Whale*, and *Toby and the Koala Bear* - which has an adorable sketch with a three-legged man. I even watch them...

The way Stefanie always wants to watch us (as well as help) prepare meals, bake cakes and cookies, and put the food away after a supermarket trip, I believe she is going to turn out to be the cook as she gets a little older. At close to 3-1/2, she at least gets the occasional job of putting the silverware away after the dishwasher has run. Now if we can just get her to pick up her toys...

Stacey is just as messy with her toys; however, when it comes to clothes, my hunch is that she is going to cost us an arm and a leg when she gets to be a teenager. That's because she exhibits a desire to be a very "neat" dresser. She likes the *layered* look, sometimes wearing three shirts. She also seems to be out of tune with the season. It's not unusual to find her occasionally wearing shorts and a tee shirt in winter, but a sweat suit in summer. Ah youth...

Letters to the Editor

TMQ swap offer

Fm Paul Bradshaw To MISOSYS: In the latest TMQ, you mentioned a "swap" offer -- get a MISOSYS product for half price with "someone else's" similar package (i.e. swap ALDS for MRAS). Is this for real? Where do I go, and what do I do? What exactly do you want to be sent (the manual is in fairly bad shape...). More details will be appreciated, and may result in a sale shortly after Christmas.

Fm MISOSYS, Inc: You heard it right. I don't care what condition its in - could be falling apart and missing pages. Just send back manual and disk(s) and get our package at 50% off. About 8-10 folks have already taken us up on that trading in such things as PFS-file for LB, Alcor C (Tandy's) for MC, ALDS for MRAS. You can cut down on the cost of mailing a bulky manual by either going UPS, or send the manual separately via 4th class or equivalent. You can even fly in and drop it off.

Greedy Vendor of the year award

Fm MISOSYS, Inc: The following letter was submitted to Mark Speer, President of The San Gabriel Valley Tandy User's Group in San Dimas, CA.

"Dear Mr. Speer, One of my customers sent along a copy of page 7 of your club's *THE INTERFACE*, Volume 8, Number 11. This page had what could be called an article entitled 'HOW TO BECOME A CRIMINAL'. The seventh paragraph (THE VENDOR) attributed the 'Greedy Vendor of the Year Award' to me for, 'he has copy-protected a DOS, and fixed the date function on earlier versions so that you have a choice of using a date-crippled DOS or a copy-protected-crippled DOS.' I must vigorously protest this statement. If my name is mentioned as the principal of MISOSYS, Inc., then the writer is totally in error. MISOSYS, Inc. publishes LDOS, a Model III-mode operating system. Our 5.3 release which extends date stamping to 1999 and introduces time stamping as well as a host of other features, is certainly NOT copy-protected. Nor is

it copy limited. Nor is it restricted to single-machine use. The statement in your newsletter has no basis of fact.

If your writer mentioned my name assuming that I had any part in LS-DOS 6.3, a Model 4-mode DOS, then your writer is totally in error. Neither Roy Soltoff nor MISOSYS, Inc. had anything to do with LS-DOS 6.3, 6.2, or 6.1. We were only the principal designer of TRSDOS 6.0.0 over four years ago. Thus the statement is wrong and should be retracted.

As a company, MISOSYS is virtually the only business left still supporting the TRS-80 Model I/III/4 market. We publish the only magazine covering the TRS-80 (THE MISOSYS QUARTERLY); we sponsor the only commercial bulletin board covering the TRS-80 (CIS LDOS forum); and we haven't deserted our customers as hundreds of other companies have done in search of the big bucks in the MS-DOS world. As a club of TRS-80 users, you people should be ashamed for printing such erroneous statements about me or my company. You are no better than 80 Micro who continues to print such inaccurate drivel. Unfortunately, once in print, it's hard to undo the damage you have done. A public apology is the least I could expect."

Fm Jim Gaffney To Roy Soltoff: FYI, your letter to Mark Speer and the SAGATUG Interface appears as page 3 of the December issue of that newsletter. On the front cover is the following banner: "-- VERY IMPORTANT NOTICE - Everyone who reads the INTERFACE must read the response by Roy Soltoff of Misosys (sic), Inc. to an article printed in the November issue of the newsletter." Or perhaps they sent you a copy?

Fm MISOSYS, Inc: Yes, John Phillipp sent me a copy of that issue with his cover letter to me. I think they really wound up with egg on their face for that one. Now if I can nail Karl Mohr from Surrey, BC CANADA for giving away my PRO-WAM product on his club's public domain (!!!) software disks, I'll have a better Christmas.

Updates/Patches

Fm Theodore Masterton To MISOSYS: Just finished the Logical Systems area in TMQ and felt a cold shudder as the writer predicted that LS will dump the Model 4 sometime in 1988. Leaves me with one fear. That MISOSYS or LS will become unavailable before I have a chance to correct my DOS's for the last time. Trouble for me is finding out when a patch is needed. Sometimes I just happen to notice an upgrade, like finding a JCL/patch file on GENIE that took care of some things apparently wrong with 5.3. Or noticing that a comment line in the back OF TMQ seems to refer to a program I am using. But I also have trouble using these sources since the language is often more technical that I read easily, or the patching requirements use some undocumented method (or not-understood method).

Is there a way a using non-programmer can be aware simply that an update or patch to 6.3 or 5.3 is needed? I don't even mind forgoing the patching technology and sending in the disk for a refresh. I just don't want to do it monthly "just in case".

Fm MISOSYS, Inc: I think that every user, especially who reads TMQ, should get comfortable with the last section in TMQ, *The Patch Corner*. As far as MISOSYS products go, there will usually be a file on the disk named README/TXT or similar. This file notes what has been done to that disk. It really shouldn't be too difficult to scan TPC and note what products the patches are for. They are always shown in the same format. Check the patch name against the README and you can tell. For those who are totally alien to this, then they can always send their disk in for a refresh. We noted the charge for that in TMQ as \$10 + S&H per product. I don't know what else I can do without getting totally redundant. Space in TMQ can't be wasted.

Fm Theodore Masterton To MISOSYS: Quite good enough. Just needed to know that I would always find 6.3/5.3 patches in a certain place and that I should not assume they will be somewhere else or that I am going to get a personal phone call when my versions need you. I suppose I can overcome my fear that I might learn something about hex or binary and get into *The Patch Corner* as well.

Tandy Acronyms: SOWG et al

Fm Mark P. Fishman To Adam Rubin: Adam, I'm afraid SOWG is a new one on me. Could you expand that acronym (short for A Convenient Reduction Of Nomenclature Yielding Mnemonics) for me?

Fm --jjkd-- To Mark P. Fishman: Sold Out When Gone. It's a common RS acronym used to indicate a special price or product that is available in limited supply, and when available warehouse stocks are gone, that's it. WIAI or Where Is As Is is another category that generally indicates that there are no more in the warehouse, and whatever you find in the stores is it.

Fm Adam Rubin To Mark P. Fishman: SOWG is the Radio Shack acronym for "Sold Out When Gone." I think its usage may have changed since jjkd's days there; in its current usage it means something like "This item is being discontinued, and will remain at the 'sale' price until the store runs out of it. No rainchecks, since we can't expect any more in." The only current use of "Where Is As Is" is the occasional page or two in the sales flyer, which means the items there are all SOWG.

Fm --jjkd-- To Adam Rubin: I don't think so. The difference is that an SOWG item can appear anywhere in the flyer, even as a, um, what's it called, oh yeah, a BlockBuster, and there can be usually is tons in the warehouse. It goes *Where Is As Is* sometime after the warehouse is empty, and will only appear as such in the flyer if inventories at the stores show a significant quantity available somewhere in the country (not necessarily any where you might happen to be). Things get complex if the item doesn't appear in the flyer, or survives *Where Is As Is*. The inventory is written off and devalued 25 percent at a time, quarterly (i.e. zero value after one year). The sell price decreases at each devaluation. They started SPIFFing these items shortly before I left.

Fm Adam Rubin To --jjkd--: True; basically SOWG means the item's being discontinued, and stays at the "sale"

price until the local warehouse's supply is exhausted. I forgot that WIAI shows up in the sale listing too, though (I suppose) these can't be ordered. I think the items not in the flyer or surviving WIAI (i.e. on the spiff list) are the most fun, for both salespeople and customers.

TMQ/LSI Corner

Fm Mark P. Fishman To William Schroeder: Bill, thank you for your column in TMQ (as well as for your past/present support of my TRS-80s). I would like to note, however, that MISOSYS is doing MS-DOS stuff and Roy doesn't hesitate to tell us about it. Some of us sigh have MS-DOS machines as well as L(S)DOS ones, and like to know about software from the programmers we have come to trust and like.

If LSI's new direction involves MS-DOS, or OS/2, or even UNIX or XENIX, I (at least) would be interested in reading about it in TMQ. A little pre-marketing isn't unheard of; maybe you could even take your customers with you. Please check with Roy, but a little less self-censorship may be in order in the LSI column.

TRSDOS / TANDY SUPPORT

Fm James J. Wood To All: This message is intended for any owner of a Tandy machine or LDOS product that feels, as I do, that there is something wrong with selling things that do not tell the customer that they will die an un-natural death at some specific time in the future. That plus a few other points - not to be dumped here - causes me to wonder how many people there are out there that feel they were not provided the proper information at the time of purchase. If so, there may be a remedy. The ideal remedy would be for a patch at about \$5.00 without any supposed super stuff added in; and not protected in such a way that it could turn our unprotected software into a monster.

I am aware of the need to turn talent and capital over into a profit. Lawyers have that problem too. My suggestion is that you consider the problems created for you by the mandate they imposed by making you change your friendly DOS and all your disks, and all else. All this nonsense when a simple patch for the date problem would let us live on for about 10 years without this mess. They can TELL us NOW that this is the last.

Fm MISOSYS, Inc: I fail to understand your position. The LDOS manual for 5.1.4 stated that the date was supported in the range 01/01/80-12/31/87. MISOSYS also does not have copy protection or any other protection which can "turn your unprotected software into a monster". Before you spout off, you really ought to get your facts together. Profit? I sometimes wonder why I still spend as much time as I do trying to support folks like you. This TRS-80 business is certainly not profitable. If it were, you'd find Tandy still pushing 8-but Model 4's, you'd find the hundreds of companies who used to be here still here instead of being long gone. Why not get off your soapbox and come down to earth? I am proud of my LDOS release. If you think that it is too much for you, then you spend the time to patch your own system. Nothing lasts forever without upgrades. Most users want, no most users

DEMAND improvements to their software. That's why they get upset when the software publishers leave them high and dry. MISOSYS has not done that to you.

Fm Joel Ordesky To All: The date on LDOS for the Model 1 will not go past 1987. IS there a patch to fix this problem. Also what happened to the company that supported LDOS for the Model 1? I am registered owner and have not received anything for a year or so. Any help would be appreciated.

Fm --jjkd-- To Joel Ordesky: MISOSYS and LSI have had continuous representation here since this Forum was opened, what say, maybe 1983 or so? Both have also been advertising in *80 Micro* fairly constantly since before that.

We've been discussing the Model 1 date options and problems here for about two years. Information regarding this issue has been published in *The MISOSYS Quarterly* (TMQ) for some time, at least a year. Are you a subscriber? If not, you can contact MISOSYS at (703) 450-4181 to subscribe.

I'll summarize the current situation for you. So few Model 1 owners have expressed an interest in buying an upgraded version of LDOS (to match the LDOS 5.3.0 for the Model 3 and LS-DOS 6.3.0 for the Model 4), that no such version will be produced. Patches have been produced that will turn off the dating functions in the DOS if desired. They are present here in DL 0, and instructions for their use and their effects are discussed in the current TMQ.

Fm Joel Ordesky To --jjkd--: While I was aware that the forum existed, due to cost I do not come here often. When the question was raised I knew where to come to get the answer I needed. I also no longer subscribe to *80 Micro* since I find little there to interest a Hard core Model 1 user. I thank you for your reply.

Fm James J. Wood To Joel Ordesky: There is a problem that should be solved by the sellers - and your Mod 1 dilemma is no different from the Model 3 or the Model 4. It seems the issue would be, in large part, what the customer was told about the life of the software when it was purchased. Were you told the software would die 12/31/87 when you bought it - or the computer it came with? I was not. The Ads did not say so. We need a group to assert the facts - TRUE FACTS - that will be able to bring this point home to the seller or manufacturer. I think they will do the right thing and provide at least one patch when they know what is at stake.

Fm James J. Wood To Roy Soltoff: Such indignation! You are mixing your fruits. First of all your records should show that I bought (from LSI) just about all of your stuff for the Mod 1 and the Mod 4. I bought 2 sets of LDOS for the Mod 1 as well as LDOS for Mod 3. I bought the second set for the Mod 1 because I did not want to turn in the earlier issue for the same reason that I do not want to UPDATE all my disks. I also purchased LS-DOS 6.3 from you - but have not put it to use. The "record" will show that I am and have been willing to pay for what I want. Some of your stuff, like little brother, I have never used but I bought it knowing it would be a good item when needed. Spouting off? That is a little harsh. Let's take a look at the way software is

sold. You, and others, run an ad for an item and make no comment as to it's life cycle. Then it is delivered in a sealed package that says opening the package makes the deal final. Now you say look somewhere in the manual and find the bad news. I have found software to be protected or limited on backups when not a word was mentioned in the ad. Have you noticed this? I used the forum to reach YOU and others because I think it's an important topic for general discussion. There is no doubt in my mind that all TRS80 owners appreciate your continued support; and look forward to it in the future. **That is not the point.** Upgrades to software may be "demanded" by your customers as you say and I am willing to concede they are desired at the least. Why must an upgrade require only one choice - YOUR MANUAL warns not to mix the DOSes. Sell me a patch to retain TRSDOS 6.2.1 and all my disks. I have purchased your 6.3 and I would have done so even if I had the chance to purchase the patch. Why must I risk writing to 6.2 when in 6.3 or vice versa and cause myself problems? Your 6.3 sells for about \$35.00 so sell the patch for \$50.00 if you want to; the point is to give us a choice, not a directive. Thank you for your response; where's my patch?

Fm MISOSYS, Inc: Jim, You are totally wrong. MISOSYS did not sell you LS-DOS 6.3; that's a Logical System's product. We don't sell any patches for TRSDOS 6.2.1. We have no authority to deal with LS-DOS 6.3 on the Model 4. If we wanted to do such a patch as you have requested, MISOSYS would be no different than any other software house. Why not take your demands elsewhere. We have neither the time nor the desire to work up patches to 6.2 - it wasn't our product. We have enough work to do in other areas. Please understand who you are directing a message to before you vent your spleen. If you have a complaint about TRSDOS 6.2, direct it to Tandy. If you have a complaint about LS-DOS 6.3, take it to Logical Systems. If you have a complaint about a MISOSYS product, direct it to me.

Fm Pete Granzeau To James J. Wood: Call the Volksboard TBBS, (804) 220-0003, and join it. It's two of the TRS-80 files there. (One permits you to use 1988-1989, and the other will work from 1990 through 1997). Anyway, the manufacturer of LDOS 5.x and of LS-DOS (TRSDOS 6) only inherited the design deficiency involved in the date problem. Blame Randy Cook, the original author of TRSDOS for the Model I, not LSI and MISOSYS! I think you're giving these good people an undeserved hard time.

Fm --jjkd-- To James J. Wood: Let me review the situation for you. (1) The accepted date range for LDOS and TRSDOS 6 has been documented from their inception, no matter what the computer model involved. (2) For the Models 3 and 4, enough people have expressed an interest in purchasing an updated/upgraded version (including additional benefits beyond the increased date range) that an updated/upgraded version has been produced. This updated/upgraded version is available for a reasonably nominal fee. (3) You don't have to buy the update/upgrade if you don't want to. Simply turn dating off, or lie to your computer as to what year it is. (4) Both LSI and MISOSYS felt that patching was an impractical way to deal with the situation - a band-aid fix at best. Without a change to the directory structure of the diskette, there are just three bits for the year. Period. Them's the TRUE FACTS. The

updated/upgraded version does provide the additional space to allow expanded date storage, along with a time stamp.

I don't understand what you want done differently. There isn't any magic wand I can wave to "fix" the old version, or to negate the costs associated with producing and distributing the new versions.

You want a band-aid fix? Fine. Somebody has one. The suggested shareware contribution is something like \$25. Compare that to the cost of the recommended update/upgrade, and the various features included. If you don't think that the upgrade is worth the price, fine. Don't buy it. Nobody says you have to. The DOS isn't going to "die an un-natural death". You can continue to use it just fine, thank you, albeit without the correct day of the week. If having the year not match the current calendar on your wall bothers you, then turn dating off.

BTW, the LDOS upgrade 5.3.0 supplied by MISOSYS never has been copy-protected. If you have a problem with the statements and policies of LSI, I recommend that you contact LSI.

I think it very sad and short-sighted of you that you would rather have a low-cost band-aid fix as opposed to 'doing it right'. You are advocating penalizing the only folks still around, who still support the machine that you seem to like enough to suggest using "for about 10 years". Worse yet, you are mad at them for doing the right thing, spending time and money to get the job done right as opposed to taking the cheap and dirty way out.

You want to blame somebody for the date limitation? Fine. Go find Randy Cook and blame him. He abandoned his products and customers years ago, leaving us with the architecture and limitations to deal with.

Speaking of mixing one's fruits, I think that you need to get your ducks in a row. First off, note that your message is addressed to Roy Soltoff from MISOSYS. MISOSYS has never sold any version of TRSDOS 6 or LS-DOS 6.3, the only related product sold by MISOSYS is a version of 6.2 for the Model 2/12, with none of the 6.3 concerns you seem so upset about. MISOSYS is the current distributor of LDOS for the Models 1 and 3, along with the majority of what were LSI's LDOS and TRSDOS 6 add-ons, in addition to all of MISOSYS's other products.

As far as I know, neither MISOSYS nor LSI has distributed any products in the fashion you mention, i.e. with an externally visible shrink-wrap license. LSI and MISOSYS have always tried to deal fairly with customers, and I know that both have given refunds for returned products on numerous occasions, even when the mistake was the customer's, and many times without even a restocking fee.

If you have concerns regarding 6.3, address them to LSI, not MISOSYS. If you have concerns about 5.3 (which I don't recall you mentioning), address them to MISOSYS, not LSI.

Fm James J. Wood To Pete Granzau: Every one seems to be quite sensitive about this item. That includes me. Your assistance is appreciated.

Fm Ray Pelzer To James J. Wood: Mr. Wood, I agree that you DO sound a little tired - tired enough to be less than coherent. If you are complaining about Tandy dropping the Model 4 line, that has been a known goal of Tandy for the last year or two. If you are complaining about LSI (NOT LDOS) and/or Misosys notifying us that there is a protection "scheme" in the operating system, You have the option of returning your software for refund if the idea of a protection program scares you. The extent of the "monster" as you call it has been outlined publicly: The DOS will NOT wipe any files: It will only "punish" you at things like the "DOS Ready" prompt.

Also in regard to that, I will quote some one here who once said, "...we only have their [LSI's] word that the protection scheme ACTUALLY exists!" Have you EVER found ANYONE who has been "bitten" by the protection? If so, PLEASE announce it here, so that we can find this person to prove he actually exists! Also, if he DOES exist, I ask you to check to see if he is the true OWNER of that copy of the DOS, and not a "buddy" of someone who owns it.

Fm Ray Pelzer To James J. Wood: Let me ask you a question: When Tandy came out with TRSDOS 6.2.0 and 6.2.1, you had to pay \$20 or so to purchase the new version... IT WAS NOT FREE! Also, Tandy - WITHOUT WARNING - issued an announcement that they would no longer support any version of TRSDOS earlier than 6.2.1. Did you pi\$\$ and moan equally to Tandy at that time?

Fm James J. Wood To --jjkd--: Your comments are appreciated. Item 2 = I bought LS-Dos 6.3 and will buy the Mod 3 update. Item 3 = I plan to lie to the date prompt for a short time but that prompt date is used in my stuff!! You may not have seen my reply to Roy S.. If I knew how to write your kind of media I would not hunt & peck this toy. The point is getting lost here so I guess I am uniquely involved and others are not. Tandy has been advised of my view. Enough already. My main point is valid. Thank you all for your time and attention.

Fm Bill Schaper To James J. Wood: Proper protocol prevents me from using the actual verbiage to properly express my displeasure with Mr. Woods contention.

If you have ever taken the time to develop a piece of software that was as "intense" as a Disk Operating System, or the excellent "add-ons" that Roy S. (MISOSYS) has, you would realize that the cost of the update is minimal!!!

I can't believe that you have the NERVE to complain about some date scheme that was never intended to last past 1987, and for a SMALL price you are able to get not only a date past 1987, but a time stamp also that is transferable between both LS-DOS (a non-MISOSYS product) and LDOS. Model I users (such as myself) would love to have such a upgrade.

I have used LS-DOS and LDOS 5.3 and drivers AND the various packages offered by Roy ... and I'll tell you one thing ... I have NEVER (if I had larger CAPS, I'd use 'em) received better support and help than from MISOSYS and Roy Soltoff. All you do is call the technical support line and the BOSS himself is on the line, to help with your problem.

Perhaps you should subscribe to the TMQ to find out where/why the Z-80 world is passing you by!

Fm jeff brenton To --jjkd--: As far as "lying about the date" is concerned, remember that Microsoft and IBM have immortalized January 1, 1980 as the day when more work was done than any other day in the history of computing!

Just goes to show, VERY FEW PEOPLE really care about file dating, those that do buy hardware clocks, but even sales of HWC's are no indication of who really wants/needs the correct time/date put on a file, since some people get them as part of the package deal in their Kaypro, IMS, AST, whatever, or they just got tired of answering the DOS prompts for date and time at bootup!

Fm James J. Wood To Bill Schaper: GENTLEMEN. The issue is being very, very confused. No one, least of all me, ever complained about the COST of upgrades. I do not expect any thing in life to be free - accurate yes. The view you all express does not show you read my lines well. So be it. I have deleted the original message. It is a TANDY problem now. To reassure you I can agree with most of everything everyone has been kind enough to so graciously tell me. Please do not waste any more of your Forum time on it. I like LDOS - I like Roy - and I like LS-DOS 6.3. I may buy some MORE copies to prove it. Once things get this confused the POINT is lost and words are wasted. Any way, I will be very busy trying to UPDATE all of my old 6.2 disks.

Fm --jjkd-- To James J. Wood: Hmm. Now I am confused. If cost is not the issue, what was the point?

Fm LSI To James J. Wood: Do you feel like you just had a ton of bricks land on your head? Without apologizing for any of the replies you have received (indeed, I thank all of you that have replied to Jim), I would like to try to lighten the load a bit. You have taken it pretty well and I hope that you continue to participate in this forum.

Now, what is this point that we are all missing? I think we all agree with you "that there is something wrong with selling things that do not tell the customer that they (the product) will die an un-natural death at some specific time in the future". The point of disagreement is your implication that that description applies in any way to either LDOS or TRSDOS 6. Perhaps it may apply to TRSDOS 1.

Or is your point that "All this nonsense, (is unnecessary) when a simple patch for the date problem would let us live on for about 10 years without this mess"? Well, a simple patch wouldn't! The patch I've seen was far from simple, and it still was not a complete solution. Nor could it be considered the SAFE or the EASY way to go.

Or is it "Why must I risk writing to 6.2 when in 6.3 or vice versa and cause myself problems?" What risk? Suppose you have booted on 6.3 and then attempt to read and write files that are on a disk that is still in 6.2 format. Is that a situation that worries you? It is no problem at all. 6.3 can handle any TRSDOS 6 disk. The only difference will be that 6.3 will not maintain the date field in the directory, because it is too small; and it will not maintain the time field, because there isn't one.

If you have a data disk that you expect to use in both 6.2 and 6.3, just DON'T DATECONV it.

I think that ties up the only loose ends I can find in this thread. If not, if we are still missing your point, why not rephrase it for us?

Fm Sam To Model 4 Users: Try this for a fix: SYSTEM (DATE=NO). End your dating troubles. Really, what's the great value of dates anyway? Put them in your program documentation under comments (?) if it's so important to you. Put it in the open-file page of S-Scripts.

If you need to keep a date in your directory, start lying to your computer. NOBODY had a Model 4 in 1982, but it will accept that as a valid date. Just start subtracting 5 years from your date. (Unless that would make her jail-bait.)

Fm James J. Wood To Roy Soltoff: As might be expected, you are right. All the loyalty displayed in the rather un-nice comments of your fans brought that home to me along the way. The original comment was TRSDOS / TANDY SUPPORT. This was a general comment - plus a plea for a patch - Upgrade too, please!! Your quick response made it specific to your stuff, I did not try to do that, but as some fans pointed out, I am a confused guy, ETC. Things did get a little off the track. Some one accused me of wanting free somethings or other and some others were not so kind. Well I do hope everyone had a good time. I was impressed with how far afield random access computer types can get. My point remains of interest to me even if no one agrees there is one. If I ever pose another question on this Forum it will be very carefully limited. Can you call off the hounds now?

Fm MISOSYS, Inc: One just has to be cautious these days as to who one is attacking. Big guys, like Tandy, Microsoft, IBM, etc., are always subject to attack. Little guys can be when they do wrong. Most folks agree that MISOSYS has been trying to do their (our, my, ???) best to support a community of users which just about every other company has forgotten. For that, we generally deserve praise (hey, we still foul up sometimes). Great to have all these folks come to my rescue.

Fm James J. Wood To --jjkd--: Thank you for this question jjkd. Hopefully this will end the topic in this Forum because I'm beginning to wonder if so many people are entitled to have so much fun at my expense. From my standpoint cost is as relative as time. If I have been working with a product and have various of my baby BASIC ideas in storage for further efforts I then have a sizeable investment of my time. The cost of the DOS becomes a nominal, or less, consideration. When a new version comes out it is normally purchased and implemented at leisure. This does not anticipate an immediate change on everything in storage or in progress at that time. The date problem with TRSDOS 6.2 changes all of the usual methods of working upwards from a fixed position. This is also of importance to people like me because I use the prompt date in my humble efforts which means I lose the programming effort as well as the DOS benefits that rely upon the date input. The date problem, to me, seemed to be so easy for professional to fix that I have been astounded that TANDY would insist upon the new release without any

alternative - my original message was intended to sell that point. I can afford to buy all the copies of the new release I want, and I have one which should be enough. THIS will not solve the problem which is the subject at issue, "The Point".

Fm James J. Wood To LSI: Hi LSI, You too Virgil. The various comments were very informative, I simply delete the unused lines. Your comments are also welcome. While I was in the middle of this reply the first time I may have had a DOS failure because things went Bye Bye. We may be done. Your explanation is quite convincing. Who wrote the Limited Warranty? The illusive point that I seem to be incapable of putting into understandable symbols is the very one that you discuss. Why should any person give up the directory date? Or why should any DOS function that can take advantage of that date be lost? Or why will the new MSDOS computer have a longer life - just on the date battery backup - than the entire DOS is capable of in TRSDOS 6.2? So we shall not belabor the point. You have advised me that patches would not be reliable. (I meant to say MY new MSDOS computer that will not be TANDY). If it is your intention to tell me that a version of TRSDOS 6.2.1 could not be with the extended date as the sole and only modification - no matter how the price compared to 6.3 then I must show my ignorance and advise it is not conceived to me. The instructions that come with programs are very important to people like me. Your explanation is also important but you are satisfied with what has been done. I have 6.3 and I have read the stuff enough to know that past efforts could be effected if I am not careful and we are back to base one. The new product will be fine - I'm sure. It will give me some new tricks as well. It will NOT provide direct and unhampered continuity and that is the point - blunted as it is. TANDY, or whoever, has reason to provide the alternative and NO ONE has said it should be free. Sell me 3 versions if you wish but please do not mandate that the company will decide when I must change - just because they created a date problem upon which the DOS is dependent.

Fm H. Brothers To Sam: For some of us, the date stamp, and indeed the time stamp, are vitally important. After four or five versions of a new program are on a disk, sometimes the only indication of which is the latest version (especially if the file names become confused) is the date/time stamp. IMHO, that alone is enough reason to update to LS-DOS 6.3 and LDOS 5.3

Fm Pete Granzeau To James J. Wood: You're by no means the first person to have come up with the problem, or to have left messages here outlining their feelings. As was indicated earlier, the whole problem was created in the Model I days, 1980. Who would have thought that 1988 would appear so soon? But really, how many copies of the DOS do you keep around? I'm using a hard drive, now, so I have three copies of a boot disk and the HD itself. The change from TRSDOS 6.2.1 to LS-DOS 6.3 took all of a free evening. If I'd had a floppy-based system as I did previously, I kept the DOS, once again, on three disks (and, of course, the master and the master backup). And those three disks are just backups of each other. You don't HAVE to use DATECONV on any data disks unless you want to (and you don't seem to need to date in the directory, just available to your BASIC programs, right?). The real problem with the patches is that it takes the existing date structure and offsets it by 8 years (until 1990--after that, by ten years). That means everything formerly dated

1984 suddenly becomes dated 1992, and during and after 1990, will say 1994. Leap years will probably be wrong, too, as I'm sure the patches don't allow for the change to them. If you don't care about the date except in a program, you will probably have to experiment with them after 1990 (I'd be willing to bet they handle 1990 as a leap year).

If you knew what I was going to have to go through to install a new release of a mainframe operating system where I work, you'd fall down on your knees and bless LSI for making it simple and easy to use! I'm planning on several weeks' work just planning the change, allowing a week of midnight shifts to make the change, and then unplug my telephone for the enraged calls from the user community demanding I revert to the previous release until they can get their software to work according to the written documentation under the new release.

Fm Pete Granzeau To Sam: The real problem is if dates are important to running software. Can you imagine keeping a dayfile without a current date? I know, you re-program to enter the date when you run the program. It still requires work, allows for lots of mistakes to happen in operation, and is inelegant.

Fm Robert G Strickland To James J. Wood: Having sat here reading this thread for the better part of a half an hour, I am impressed with your willingness to deal with so many respondents who seemed upset with you. Would we all had that kind of patience and persistence.

Fm Sam To H. Brothers: I can appreciate the need for dated files. I put this in the second line of code as a remark. The first line is the name the file is saved under. Obviously, it is easier to look at the DIRectory and get the date and this could be important for someone who is as computer-intense as you, but it doesn't seem to me that such a trivial (?) thing should have everyone's bowels in such an uproar.

Fm James J. Wood To Pete Granzeau: So - as the world turns - so do the dates. It is too late to get off, or possibly too early. I would like to meet you some day.

Fm James J. Wood To Robert G Strickland: It is all in fun! I do not want to use up the Forum space but your comment reminds of a tragedy in our neighborhood recently. It seems that one of my neighbors had a problem with the local pigeons, or thought he did, so he baked up a bunch of BB loaded bagels for them. I assume they were local pigeons / seen one YHSTA. One aggressive pigeon got a lot more than his share and found he couldn't fly. A neighbors cat noticed this and ate the neighborhood pigeon. The neighborhood cat was a little heavy now and moved a little slower so he got squashed by a passing car. This was a neighborhood tragedy - in a way. The moral in this story is not that pigeons should not eat bagels or that cats should not eat pigeons - it goes a little deeper - you see, when that car squashed that cat most of the neighborhood windows were broken with the flying BBs. The neighbor has not made any friends with his efforts to correct the pigeon problem and that is the way that sort of thing works.

Fm James J. Wood To Roy Soltoff: Comment noted. Your original May Day call to the Clan worked - at least for

some added confusion. What did you folks do before my first message appeared? NO answer is required. I may get a MISOSYS KILT of my own. It has been educational, Thank You.

Fm James J. Wood To --jjkd--: You are right; again. The problem as posed is not disputed. There are other ways to reach the same supportive conclusions depending upon the facts presented as the foundation for the supposition. I think your Forum has exhausted its conception of the primary issue and why my view is untenable. Possibly my contention was so simple and elementary that hi tech progress fails to acknowledge it. There is no apparent reason why the identical DOS could not work with a date change and still permit me to swap the DOS all I want - as long as I stay within the dates allowed - and I otherwise use a DOS disk that is configured, etc., the same as what I started with.

I have enjoyed and appreciate your help. I understand your position, and the clans, better than you do mine. Let us be done with it. I may really need your help some day!

Fm --jjkd-- To James J. Wood: The problem with any change in the dating scheme making a new/different version of DOS is as follows: Dates are referenced in many different places in the system. Each place that references any of the date structures (in memory or on disk) would have to be changed. The problem is that once you change one byte in the code, any/all internal address references can/will change. Lots more than one byte in the code would have to change to support an enhanced dating scheme, something like half the system overlays and a good portion of the DOS core would be affected. Now, you swap in a diskette as a system diskette that expects to find something at a particular place in memory, and it ain't there anymore.

I think that you'll find that all us folks are terribly opinionated on everything, not just OS dating. Speaking of, did you see that dog that MS-DOS was out with last night?

Disk Notes 2.2 - public domain?

Fm Ronald Mattson To Roy Soltoff: As you know, I purchased Disk Notes 2.2 with the TMQ. I should of realized that it would be a DD Disk. As I have SD it was of no use to me. However I am not asking for a refund, what I would like as I understand that the programs are PD to donate the Disk to my user group Micro Eighty Computer Club of Ottawa. I will not donate it without your permission however, as I understand the potential loss of revenue to Misosys. Do you know if any of the old anthologies of the LDOS Journal are still around. I would be interested in buying it if available.

Fm MISOSYS, Inc: You understand incorrectly. The programs on Disk Notes 2.2 are not public domain. The fix file may be freely disseminated. That is the only file which we have placed in our forum files for download. We have tons of the old LDOS QUARTERLIES/LSI Journals which are in the Volume II set (issues 1-6). We currently sell them for \$9.95/set + appropriate S&H. The LSI Anthology is not available.

The troubles of January 4, 1988

Fm Lynn Sherman To Roy Soltoff: I can imagine that more than a few folks found out the hard way that the DOS date was defunct. In fact, one friend of mine at the office ran up against it. Since he is a USER and not into the inner workings even a little bit, I just turned off the date prompt for him. I don't think he ever looked at the date in the directory listing anyway. He just couldn't get the "computer to work". Well I hope you are selling tons and tons of LDOS 5.3. Sounds like something TANDY would do - give your number instead of Logical Systems for the 6.3 upgrade. Happy New Year! From Fort Worth.

Fm MISOSYS, Inc: I think a lot of Tandy folks are just giving out both numbers. Now what do you think a person will call? An 800 number, of course. We are extremely irritated over this entire mess. And no, I don't think we will sell tons of LDOS product - we'll probably pick up sales of maybe 300-500 this month. That will bring us to about 2200 units if we sell 500. But these are the folks who will call when they get the update to ask how to install it! Believe me, there are many frustrated and upset people around these days: here, at Tandy, and users. Most of the upgrades we're getting orders for now are from folks who bought Radio Shack's "Hard Disk Operating System" which was manufactured by Tandy under license from LSI. The way Tandy gave out our phone number, we're even getting calls for customer support on Deskmate, Profile, you name it. We gave up answering our 800 number in the morning. The entire affair is definitely no "<grin>".

Fm Lynn Sherman To Roy Soltoff: There's no doubt that the folks that are just finding out that their systems won't accept 1988 date are not the most "computer literate" (whatever that means). Guess things will start to settle down in a week or two. Meanwhile, there's nothing like an 800 number to bring in phone calls. I hope enough of them generate sales to offset the phone bill.

Fm MISOSYS, Inc: Unfortunately we are getting more calls for Model 4 TRSDOS 6 upgrades, not to mention customer service requests for Deskmate, etc. I will defer my response to your specific query until I get my 800 bill. As an aside, my guess is that 95% of the folks actually calling to get an upgrade for their "LDOS", are folks who purchased Tandy's "Hard Disk Operating System" which was a product manufactured by Tandy under license from LSI. That was a pure Tandy product and not an express order item nor an item purchased for resale (like the floppy LDOS 513R product). In my estimation, Tandy had an obligation to their HDOS customers to inform them of their options prior to 1/4/88.

How Tandy sells computers, #1

Fm Michael Dauphin: Well I took the plunge and put a 10% deposit on a 4D to be delivered next week. I ordered from a RS store and not a computer center. The computer center people did not seem at all interested in talking about the 4D. They said it was discontinued and insisted that I buy an MS-Dos machine, "Your just wasting your money with a model 4. Anybody who knows anything at all about computers would not buy a model 4, you know that is the machine which gave Tandy computers the reputation of having trash 80's."

No wonder the Trsdos world is shrinking so fast. These guys (and gals) who work in the local computer centers not only don't know anything about computers, they are also unwilling to even attempt to find answers, and they know NOTHING about customer relations. He even told me that the reason Tandy stopped selling the 4D was because it is unusable after 12/31/87, and that it can't be fixed because it is a hardware problem! I kept my cool and asked if the mod 4 will come with LS-dos 6.3 He walked to the back of the store and hollered thru a door, "Hey Marty, does that cheap model 4 come with something called dos six-ihree"? Marty answered, "I don't think so." So the (so-called) salesman sauntered back toward me and said, "It doesn't come with dos." I left and made tracks to the local RS store (as opposed to the computer center). I talked to the manager and he said, "gee, I didn't think we sold those anymore, but I'll be glad to check." This I can understand from a regular RS store. I asked him to check on ls-dos 6.3 at the same time. He went to the phone and called the computer center I just left. I guess he talked to the same salesman I had talked to, because he told me I could order a 4D at the computer center and no, it doesn't come with dos! I told him I had reason to believe that was wrong and asked him if he could check with someone who might know more. He called Ft. Worth! Yes the 4D comes with ls-dos 6.3. He can have one for me in two days, and, surprise, Ft. Worth said the machine is not being discontinued, 'features' are being added. The price will be more than \$600 and less than \$1200. I wonder, rumor or fact?

How Tandy sells computers, #2

Fm Gary Phillips: Roy, the problem (as usual) is that Fort Worth has one story in some offices, and another story in other offices, and the retail stores don't know anything about it so they are making up their own different story everywhere. (Note messages above about being told that the model 4D doesn't come with a DOS, and that the date problem is a hardware problem that can't be fixed.) A friend of mine in Seattle who bought a 4P on my recommendation when they were on clearance has been hassled and hassled until she refuses to talk to the RSCC personnel any more. Instead, she calls me long distance whenever she has a question. When she went to the store with her LS-DOS 6.3 upgrade letter (because I told her they could express order 6.3 for her), the jerks sold her 6.2 and told her it was the same thing. Guess who she called on January 4? I gave her LSI's phone number and suggested she take 6.2 back to the store and throw a screaming fit. She reports that the store then told her 1) the 4 is obsolete and discontinued, 2) the 4 is no longer supported by Tandy, and 3) the date problem is a "hardware" problem that cannot be fixed! They then tried to convince her she should buy an MS-DOS machine. She walked out, fortunately. You certainly have my sympathy in the frustrations of dealing with Tandy's destructive marketing behavior. (If your 800 bill is greatly enlarged by their stupidity, you might have grounds for a lawsuit.) And thanks once again for your continued support of us stubborn Z80 users even though the great powers have decreed that we should all crawl in a hole and die.

Fm MISOSYS, Inc: Perhaps a letter to Ft Worth noting the facts along with the salesperson's name and store would at least operate to get rid of one flunky. Methinks that turnover in their stores is now becoming a great problem.

How Tandy sells computers, #3

Fm Kent Fasick To --jjkd--: The whole Radio Shack sales network seems to be screwed up whenever a non-MSDOS machine is involved. I ordered a Mod 3 to 4 upgrade kit in September 87 from a local store. They passed the order on to a computer center because "we aren't allowed to order that through the store". They sat on the order till mid October and then sent word that the upgrade had been discontinued and there was NONE to be found. So a call to National Parts got me the upgrade (FINALLY), but they shipped it with TRSDOS 6.1.2. Calls to the local Computer center, ATSO, and FT.Worth helpline yielded "sorry, but that is the only dos version available from Radio Shack for the Model 4". Good thing I didn't have to ask a really tough question like "where is the ON-Off switch", I probably would have been told Tandy didn't supply it with one!

The SOURCE

Fm Glen A. Dobbs: Being a relative newcomer to the TRS-80 world, it was more than a pleasant surprise when I called your company approximately one year ago to order *THE SOURCE*. I was prepared to pay \$100.00, the advertised price, but ended up getting the special deal of \$49.95 for *THE SOURCE*, a subscription to TMQ and PRO-DUCE, the disassembler, for the same price. [note that *THE SOURCE* was a TMQ coupon special at that time. -ed] It is no wonder that I renewed my subscription to TMQ even though the contents make it a worthwhile buy all on it's own. I have used the information therein to troubleshoot a memdisk problem, to reconfigure my old double/single density drives to the new system and to assist a friend to upgrade his Tandy 100SX to 640K memory. I must admit 80 Micro was also helpful, but now that they have ceased TRS-80 coverage yours is almost the only game in town.

THE SOURCE is worth it's weight in any precious metal for someone serious about learning low-level programming. Coupled with *The Programmer's Guide to LDOS/TRSDOS Version 6*, a TRS-80 Model 4 becomes a serious development system capable of just about any task one wishes to undertake. If I didn't have a Model 4 already I would certainly buy one now that Tandy is closing them out at half price.

Well enough said about MISOSYS. I also want to send in the following patches which free ALBUG/CMD, the debugger provided with Tandy's ALDS for TRSDOS 6, to look at all of memory instead of being restricted to X'3000' to X'DF00':

```
PATCH ALBUG (D04,06=00:F04,06=30)
PATCH ALBUG (D04,0F=FF:F04,0F=DF)
```

LDOS and Model I/III Information

Customer Support

Limitations of customer support

Fm MISOSYS, Inc: The following notice was included with our LDOS 5.3 shipments effective January 20, 1988.

Due to the totally excessive quantity of customer requests for detailed assistance in installing the LDOS 5.3 Upgrade Kit into Hard Disk drive environments *neither provided by nor the responsibility of MISOSYS*, the following policy has been instituted:

1. MISOSYS will, in general, provide no telephone assistance covering the installation of any non-MISOSYS product including but not limited to Radio Shack hard disk drivers, Megadisk drivers, Software Support drivers, Aerocomp drivers, or any other hard disk driver not sold by MISOSYS.

2. If you are unable to install our system with the instructions provided with the upgrade, or are unable to locate someone locally who has expertise sufficient to implement the upgrade, we offer you two options.

(a) You may return the upgrade kit within the 30-day period of time which qualifies you for a refund of the product's price (this excludes cost of shipping), or

(b) If you are using a Radio Shack hard drive system, you may request detailed written assistance covering the installation from us for a fee of \$25 payable in advance. If you choose to have us provide detailed assistance to you, you will be sent, on disk, a copy of an installation Job Control Language (JCL) file customized to your current configuration along with very specific instructions tailored to your needs and your particular configuration. In order to provide you with this service, we need to

receive, by mail, the following information along with your payment of the \$25 fee:

1. The printer listing generated from the command:

DEVICE (P)

2. The printer listing generated from the command:

FREE (P)

3. A copy of your existing LDOS 5.1.x STARTUP disk.

The \$25 fee includes UPS ground shipment charges within the Continental United States.

Patch for COBOL programs

Fm MISOSYS, Inc: Our thanks to Gregory Murrow for providing us a set of disks which we were able to use to run down a problem with using Tandy's COBOL under 5.3 LDOS. Here's the word we're now putting out with each LDOS 5.3 shipped.

Some of Radio Shack's software packages are compiled using RS-COBOL. The RUNCOBOL/CMD program is coded to test the operating system version number by comparing it against "51". Since our LDOS 5.3 release establishes "53" as the operating system version (OSVER), these COBOL programs fail with usually a *Runtime error 20* or *GAT error*. To eliminate this problem, you can usually patch the *RUNCOBOL/CMD* file to compare against "53". This patch, typed from *LDOS Ready*, is as follows:

PATCH RUNCOBOL (D65,97=53:F65,97=51)

Please make note that the newly patched RUNCOBOL cannot be used in 5.1.4 after application of the above patch. As more than one release of COBOL exists, this patch may not work for you. Since we have not identified all of the versions of COBOL which Radio Shack has released, the other alternative is to patch LDOS to fool the world into thinking it is a 5.1 release. Thus, if application of the above patch does not take effect, the alternative patch to LDOS on your startup floppy is as follows:

PATCH SYS0/SYS.SYSTEM:# (D02,87=51:F02,87=53)

where "#" is replaced by the disk drive designation which contains your startup floppy disk.

Model III LDOS Upgrades

Fm Keith Davis To MISOSYS, Inc: A friend of mine in Iowa tried to upgrade his hard drive (Model III-based) from 5.1.3 to 5.1.4 and had trouble. He also had trouble getting the info explained over the phone (by you). I was putting off the misery as long as possible. I'll do a careful backup and try the upgrade as a Christmas project. Wish me luck!

Fm MISOSYS, Inc: We have been plagued by folks totally unwilling to read even the first paragraph of our documentation (which addresses the issue of the README file and tells how to read it). These are the folks with a 5Meg Radio Shack drive; we put a JCL file onto the disk and covered it in the README file. When they call and ask how to install it on their 5 Meg drive, and they tell me they haven't read the documentation, I offer no sympathy. The \$34.95 of the package doesn't cover that kind of support. Perhaps MISOSYS should start charging for telephone support like a lot of other companies are these days.

Model I LDOS

Model I LDOS

Fm Jody Nelis To all: It has just come to my attention that my Version 5.3 LDOS for my Model I is not going to accept any dates after 12/31/87. Does anyone have a patch to keep it going beyond that?

Fm MISOSYS, Inc: First, you don't have a 5.3 version of LDOS for the Model I; you have either a 5.1.3 or 5.1.4 version. Second, Issue II.ii of *THE MISOSYS QUARTERLY* will have a set of patches to deal with extending DATE\$ dating to 19999 (sic) and deactivating directory dating. The patches are also available in DISK NOTES 2.2 and on this forum [CompuServe PCS-49] in a file to be called FIX22.TXT.

Fm Kevin R. Parris To MISOSYS, Inc: Wait a minute, Roy. Do you really mean that?? DATE\$ to 19999 for the Model One, but for the Model Three you only offer 1999? I know, it was just one of those slipped fingers, right? I read message number 87051 twice, and you really did say "19999" in it (that's right -- until just before the year twenty thousand!!). By the way, I hope this question is not a "sore spot", or anything like that, but I only began frequenting this forum just over a year ago (only got the 4/p in 1985, during closeout, and it is my first home system)-- why does TRSDOS 6 or LDOS 5 need patching or revision for date handling beyond 1987 in the first place? The real point of this question is not "because there are not enough bits assigned for the year in the directory", but rather "WHY are there not enough bits assigned"; or, "What were the other considerations involved in the decision to use 1980 as the system calendar base value, and use only three bits in the disk directory date field?" Again, I do not mean to stir up a big controversy, but I am curious as to why the system was planned for a specific life expectancy of only eight years. If this is too much to go into in a forum message, perhaps a few pages in TMQ?? I recently renewed, and am among the extremely fortunate ones who started with the first issue.

Fm MISOSYS, Inc: A directory only has 32 bytes. The entire set of directory bits (exclusive of the high order bits of the filename/ext) have been assigned and in use at least 6 years ago. Only three bits were assigned for the year (probably because the original designer felt that the DOS would not live

past 1987?). And no, sometimes I have bouncy keys - the Model I date is 1999.

Fm Kevin R. Parris To MISOSYS, Inc: "(probably because the original designer..."? My copy of the LDOS 5.2 manual lists a "Roy Soltoff" as Systems Analyst on the "team that made LDOS possible". I had expected a more precise reply to my question. I thought you were one of those who originally prepared the design, and would know EXACTLY why only three bits were assigned for the year.

Fm MISOSYS, Inc: The design of the directory structure predates LDOS. All systems which are DOS based (excludes CP/M) for the 4/III/I are derived from the design structure of TRSDOS 2.x (or 1.x if you really get down to it). That's because compatibility issues dictate that certain design structures be adhered to (i.e. the directory structure). The Model I DOS released by Tandy dictated every byte in the directory except for the 2nd & 3rd. That came into being with VTOS 3. Randy Cook was the original designer of TRSDOS; his company put together VTOS when he and Tandy split "friendships". TRSDOS has its roots in the architecture of a Datapoint system which used a discrete logic CPU (in contrast to a CPU chip a la the 8080 or Z80) which had an instruction set surprisingly like the 8080. Thus, although I was part of the original design team for LDOS, I nevertheless had to adhere to historical standards for certain structures of the DOS. You don't get this kind of information reading the drivel of what was purported to be the history of the TRS-80 as spelled out by 80 Micro.

Fm Adam Rubin To MISOSYS, Inc: Ah, so that's what TRSDOS was originally based on! Were the features offered by LDOS (e.g. device independence) inspired by any existing systems?

Fm MISOSYS, Inc: The architecture forming the foundation of device independence was part of TRSDOS (Model I). It just wasn't fully developed. What most folks don't understand is the extreme similarity between Device Control Blocks (for character devices) and File Control Blocks (for disk "block" devices). As long as the DOS provides a character I/O service call (@PUT, @GET) which works with either character devices or block devices, you can easily have independence. You just have to add the rest of the supporting modules. You also have to have no differentiation between text and binary files - they all have to be treated the same. This contrasts with CP/M and MS-DOS which have differing file types. The "streams" in UNIX are better correlated to character I/O under TRSDOS/LDOS/LS-DOS, et al. The basis for device independence rests with the I/O handler which operates off of the @PUT/@GET/@CTL services. Tandy really screwed that up in the Model III and it took LSI a lot of fancy footwork to circumvent the mistakes which Tandy made in the Model III ROM. My hat is off to Tim Mann who came up with the reasonable workaround which we did in LDOS for the Model III to circumvent Tandy's screwup in the ROM.

Fm Adam Rubin To MISOSYS, Inc: You mean the NZ for successful device I/O, but Z for successful file I/O? The Model III ROM, and Tandy's Model III DOS, are definitely among their less successful accomplishments. We can't

say they didn't learn anything, though, since they didn't make the same mistake when they needed a DOS for the Model 4.

Were all of the "new" (non-TRSDOS) features in 5.x and 6.x conceived by you and your colleagues? (For example, the sub-directories and I/O redirection in MS-DOS 2.0 were obviously not an invention of Microsoft!).

Fm MISOSYS, Inc: Fm MISOSYS, Inc: No, Tandy screwed up the I/O handler. Compare the code which deals with @PUT/@GET/@CTL in the Model I ROM vs the Model III ROM. Commenting on "all of the 'new' features" would be tough since I would not know specifically what you would be referring to. Perhaps one day the story will be told in its entirety.

Model I LDOS 5.1.4 DATEFIX

Fm Ronald Mattson To Jody Nelis: Jodi, how did you manage to get the datefix to work? I bought the disk notes 2.2 with TMQ that didn't work then DLED the file from the SIG and used a text editor to separate the fixes, which in my case is not easy as I recently had a stroke and find it hard to type. That is why I bought the disk notes disk. Any help would be very deeply appreciated.

Fm Ronald Mattson To --jjkd--: I am completely baffled about DATEFIX for the Model I. Have typed in the JCL from TMQ. Didn't work, next downloaded FIX 22 from the DL. Edited it with LeScript, didn't work. The JCL aborts and gives me the following /*f== job aborted. I have checked to make sure the correct values as entered in TMQ were in the file. There was no typing error. Next tried to patch directly. I get a patch file input error. I wonder if my backup of Master is at fault? I have not touched the Master which is an LDOS 5.1.4. Is it possible to send in the Master and have the patch applied by MISOSYS? In the mean time I shall continue trying to apply the patch. I must admit that I am learning a great deal about JCLs and patches. It is probably something very stupid that I am doing or not doing.

Fm MISOSYS, Inc: You should be somewhat familiar with JCL FIX file construction. Those lines in the FIX22 file starting "/*%" as well as the line which follows that line are not to be typed into your FIX file if you are typing it from the TMQ. They are there to permit automatic separation into discrete files by a utility provided on the disk.

Fm Jody Nelis To Ronald Mattson: Here's the procedure I used to apply the DATEFIX Patches to LDOS 5.1.4. Add the following MISOSYS files to a LDOS system disk containing all of the LDOS SYS files and PATCH/CMD: DATEFIX/JCL, S0/FIX, S3/FIX, S6/FIX, S7/FIX, and BU/FIX. Insert this disk in drive 0. Insert the LDOS system disk that you want to patch in drive 1. From the LDOS prompt, enter the command DO DATEFIX (DRIVE=1). Repeat the last two steps for each LDOS system disk that you want to patch. Finally, to patch the disk in drive 0, enter the command DO DATEFIX (DRIVE=0).

Fm Ronald Mattson To Jodi Nelson: Thanks Jodi, I will try that. The darn thing has been driving me nuts.

Fm Ronald Mattson To Fm MISOSYS, Inc: I finally managed to patch the date extender O.K. The problem I was having was a space where it should not have been. It took quite a while to spot it. Every thing is working O.K. Do you still have any programs in stock for the Model I. I was mildly surprised that a catalog was not included with my order. I would be very interested in getting one, if available.

Fm MISOSYS, Inc: Just about anything we have in our portfolio for the Model III will work on the Model I. We no longer have a catalog for TRS-80 products. We have put together a 6-page flyer for TRS-80 stuff. Neither our former catalogs nor our current flyer will fit into the mailer we use when we only have to send out a diskette (such as the Disk Notes). If you had ordered anything else from us in the past years, you would have had a catalog included with your order. We will also be publishing the entire flyer in the next TMQ.

Fm Ronald Mattson To Jodi Nellis: Finally got the patches applied O.K. Had a bit of a problem with a space being where it shouldn't have been. I learned a lot in the process and do not begrudge the time spent for that reason.

Fm Pete Granzeau To Ronald Mattson: You should get a Doubler. Someone is still offering them, I think.

Model I speedups

Fm Richard Forbes: Can you provide patch to LDOS-514 to alter SYSTEM (FAST) to issue an OUT PORT 254,5 or OUT PORT 254,12 command instead of an OUT PORT 254,1? Also, what would be the correct code to insert in the configuration line of SU+3.2 to accomplish the same PORT command? Also, is there a patch for LDOS-514 to update the date prompt?

Fm MISOSYS, Inc: Those port speed patches were printed in the LDOS QUARTERLY, Vol 2, #1 January 1, 1983. Don't know about SU+. Check FIX22.TXT for date patches to Model I 514. That should be in DL5.

Model III LDOS

TRSDOS 1.3 to LDOS 5.3

Fm Ernest Harris to MISOSYS, Inc: Recently, I purchased LDOS 5.3 upgrade and I would like your assistance in upgrading program disks, TRSDOS version 1.3. Fix Disk II does not accommodate such programs as PROFILE III, version 01.00.00, TIME MANAGER, PASCAL version 02.00.00, etc. Also, the KI/DVR patch gives the following message: *Must be installed via SET*. I do not understand this procedure. I have the Model IV with the right arrow cluster.

Fm MISOSYS, Inc to Ernest Harris: You are in error: LDOS 5.3 is not an upgrade from TRSDOS 1.3; it is a conversion - the difference is not semantics. You need to be aware of the paragraphs noted at the beginning of the auxiliary sheet entitled, *Please READ this information*.

PROFILE III does not work under LDOS; PROFILE III+HD does. That version should be available from Radio Shack. I am enclosing a copy of Radio Shack instructions referencing PROFILE and Time Manager. Radio Shack released PASCAL after 1982; I would assume it should function under LDOS.

The proper method of installing the KI/DVR keyboard driver (it is not a patch; it is an enhanced keyboard driver) is noted in our user manual. It is installed via a command such as:

```
SET *KI KI (TYPE, JKL)
```

The parameters, *TYPE* and *JKL*, are optional.

DATEFIX/JCL and MOD flag

Fm Mark P. Fishman To Roy Soltoff: An effect of the patch to SYS3/SYS to disable the updating of the MOD date on file close is that the updating of the MOD flag is also disabled. Is there any danger to the directory structure or files in not applying this particular patch? I have disabled the DIR display of Mod Date, and so on, but would prefer to have modified files marked as such. At the moment, I have applied all the patches except the one to SYS3. The only side effect(s) I have noticed is that the wrong date appears in the old date field (when examined with an unpatched copy of LDOS 5.1.4), but as this is invisible normally I don't care. I'm just worried about an overflow condition biting me someday. What's your feeling about this approach?

Fm MISOSYS, Inc: Since the year field is not ANDed with 7, anything beyond 1987 would screw up the adjacent field. Of course that field stores the day; it really is inconsequential.

@EXMEM and MAX-80

Fm Bryan Headley To MISOSYS, Inc: I played with @EXMEM on 5.3 (your Model 4 Interface Kit). Got it working on the Max-80 okay, but found that all your memory regions are already used. Which means rewriting MEMDISK/DCT and BANKER. (I wish those programs would check @EXMEM to see if it points to code preceded by a high-memory driver header, instead of going to OPREG\$, flipping banks of RAM in, and determining from that whether the machine has 128K or not! Why, because obviously those routines don't work on the Max-80, and also these routines may know that 128K is installed, but they don't know that SET2RAM is loaded.) As a matter of fact, even the 3012 and 3015H vectors are verboten. What can I do? Obviously, I have the ability to re-write SET2RAM, BANKER and MEMDISK to reflect changes, but in so doing I lose portability to any code that uses @EXMEM.

Also, did you know of a 'bug' in DSMBLR? When it tries to do a: "M2033 EQU \$-9", but M2033 turns out to be greater than "9", the system spits out offsets that are punctuation symbols (binary 10 = ASCII "9"+1). I had a good laugh.

Applied the Model I 5.1.4 patches to my brother's system. It's still 5.1.4, though! That's a problem; I went into SYS0 and changed the version number to 5.1.5. I strongly suggest doing

likewise, as folks now won't know what they've got (especially if they are not technically inclined). How tough would it be to do a 5.3.0 for the Model I? I'm of half a mind to look into this. I have a 5.1.4 Max-80 and a 5.3.0. Pulling up the differences, I should be able to incorporate the changes into an existing Model I disk.

Fm MISOSYS, Inc: The programs you refer to were specific to the Model 4 which the MAX-80 is not. Were I to consider that the Max was worth writing for, I would have done a version for that.

Also, I know that the problem you related with DSMBLR was fixed years ago. See NOTES FROM MISOSYS, Issue 2 dated December 1, 1983 (!!!!!) on page 2-10 for the appropriate patch. Come on now, your report is four years late. I will not waste time with the version number of 5.1.4 Model I when applying the patches. We stand by our statement as to the reason for not doing a Model I 5.3 release. Too ancient... Too few. No return on our investment.

Fm Bryan Headley To MISOSYS, Inc: Don't worry about that - I got the code to work. It's just that the location of the vectors are off, which causes problems. (And if, say, XLR8 also had problems, a mutually beneficial vector might be agreed on).

I thought that the "bug" in DSMBLR was old; to prove that, I went off and ran my Model 4 version with no problems. Don't worry, no one will make you sell the stuff. I'm just considering the idea of doing it for myself. (But no, there AREN'T too few Model Is - there are just too few Model I guys who still keep their ears tuned to the LDOS SIG. In fact, a recent survey on usenet {UNIX network} revealed 1,000 Model I owners on the net who use their boxes daily)

BASIC

INKEY and LBASIC

Fm John Shanafelt: I have a question about the INKEY\$ function with LBASIC 5.3. Most BASICs (including Model 3 ROM BASIC) seem to save the keyboard character so that the INKEY\$ function is executed as soon as one presses a key, even if the program is in the midst of some other routine. With LBASIC, this seems to be accomplished with KI/DVR. Unfortunately, I have several programs which will not run with KI/DVR. And without it, the INKEY\$ function is very sluggish. I assume there is some place in LBASIC which sends any INKEY\$ character to the KI/DVR buffer; does anyone know a simple POKE I can add to my programs to disengage this, so that the normal ROM BASIC INKEY\$ buffer (or whatever it is) will be used instead? This seems easier than trying to rewrite the offending programs.

Fm --jjkd-- To John Shanafelt: You've got it backwards, John. The type-ahead function of the KI/DVR is what saves the keystroke for later interpretation the next time that the INKEY\$ function comes along. You might try putting

the KI/DVR in, and then using SYSTEM (TYPE=N) or RESET *KI before those programs that don't like the KI/DVR. SYSTEM (TYPE=Y) will reverse the equivalent above, and SET *KI etc. will reverse the RESET (and should reuse the old memory allocation. JCL should be helpful in doing this kind of stuff automatically.

Fm John Shanafelt To --jjkd--: I asked a while ago about disabling KI/DVR with LDOS BASIC, since some programs I have don't work with KI/DVR activated, but the INKEY\$ function doesn't work very fast without it. I tried your advice, but it doesn't work (the program simply hangs up and the computer has to be rebooted to get it to do anything). I guess what I need is some way to use the INKEY\$ routines (or the keyboard routines) built into the ROM. The programs work fine with TRSDOS 1.3 (which I hate) and NEWDOS80 and Multidos. If you can't come up with anything else, thanks in any case for your trouble and happy holidays!

Fm --jjkd-- To John Shanafelt: I really don't have any other suggestions. The way that LBASIC handles the keyboard is quite different from anybody else's TRS-80 BASIC, it was re-designed to work best with the rest of the LDOS device structure. Well, I lied, I did just think of something else. If you boot up with the <CLEAR> and the <LEFT ARROW> I think (you can check it in your LDOS manual), the ROM keyboard driver is left in place. You can check the driver addresses reported by DEVICE to be sure you got the right one. That might make a difference.

Fm MISOSYS, Inc: Let me see if I can clear this up since the reason for the INKEY\$ effect prevalent in the BASIC supplied with LDOS being discussed pre-dates a lot of the folks currently following the LDOS scene. The issue goes back to the old Model I days and a DOS called VTOS. I believe it was version 4.0 which introduced type-ahead. There were many folks who were downright elated over the improved keyboard response of the system when type-ahead was used. They were so enthused, that they lodged complaints over the fact that type-ahead was not functional while running BASIC. Now BASIC at that time was not provided with VTOS; It was necessary to obtain the BASIC from a TRSDOS 2.3 disk. VTOS provided a set of patches to improve some aspects of BASIC; however, Randy Cook, the originator of VTOS, never provided a means to overcome the problems which prevented type-ahead to function while in BASIC.

If memory serves me correctly, it was Earle Robinson (who remembers him?) who first discovered why BASIC defeated type-ahead. He made his discovery public so we all could benefit from his analysis. When LSI wrote their disk BASIC extensions for LDOS, Earle's input was incorporated into the scheme of things.

Now the reason why BASIC defeated type-ahead is the very reason why INKEY\$ operated as it did under TRSDOS, Dosplus, MultiDOS, Newdos, and all the other DOS products. The ability which BASIC has to interrupt or pause a running BASIC program stems from its constant @KBD (keyboard scan) performed at the conclusion of every BASIC statement (this is not at every line, but at every line or colon terminator). BASIC essentially scans for a key; if it is a BREAK, then it halts the program. If it is a SHIFT-@, then it pauses. Anything

else is ignored. However, if a key was fetched, it is stored in the one-character buffer at address 4099H.

An INKEY\$ operation will check that location and return its value if it finds a non-zero value stored. Otherwise, it scans the keyboard to see if a key is pressed at that time. Some folks even went so far as to write programs which peek that address. Of course that would work with a "normal" BASIC.

The astute programmer should readily observe that BASIC's action at each statement would certainly operate to flush out any keystrokes typed ahead of any keyboard requests coming from the program; no matter how fast you typed, you would not be able to "pre-store" characters which were being "eaten up" by BASIC's constant scanning.

The LDOS solution to this problem, and it was certainly considered that the destruction of the type-ahead capability in BASIC was far more severe than the reduction in INKEY\$ operation, was to introduce an interrupt keyboard scanner which would check for the presence of three functions: BREAK key depressed, PAUSE key depressed, or ENTER key depressed. The result of that scan was encoded into the KFLAG\$; the scanner became known as the KFLAG scanner. Furthermore, any program provided with LDOS which needed to check for a BREAK, PAUSE, or ENTER character, was coded to check the appropriate bits in the KFLAG\$. This was documented years ago. Thus, LBASIC was written to trap the ROM's constant scanning of the keyboard at the conclusion of each statement and instead check the KFLAG\$ bits for the BREAK and PAUSE indicators. That, of course, meant that the constant scan at each statement would not be checking for the presence of any character to stuff into the INKEY\$ buffer.

The end result is that under LDOS' BASIC, INKEY\$ appears sluggish because it only will return a key value if the keyboard is operated at the time the INKEY\$ is invoked. Any given BASIC program must take this into account. Also, any BASIC program which tries to peek 4099H for such an INKEY\$ value will not properly function.

Finally, it matters whether you have KI/DVR installed with or without type-ahead. Since the INKEY\$ routine will always issue an @KBD call because LBASIC will never store a character in the INBUF\$ (4099H), by having the LDOS KI/DVR installed with type-ahead turned ON, INKEY\$ will correctly work (i.e. read immediately respond) because type-ahead will have the character(s) stored. On the other hand, if you are not using type-ahead, INKEY\$ will be very "sluggish" and would still not behave as it does under other systems because our BASIC is written to use the KFLAG scanner to detect the presence of BREAK or PAUSE. There is no way around that.

LBASIC 5.1 on 5.3

Fm MISOSYS, Inc: A few users have complained that some of their programs which ran under LBASIC 5.1.4 will not run under BASIC 5.3 because of memory constraints. Seems their programs used every bit of available memory. Now the features which have been added to BASIC 5.3 resulted in it being a little bigger, thereby taking up additional memory. One solution is to reduce the memory usage requirements of the affected program by cutting back on array sizes.

For some, that solution may not be reasonable. An alternative is to copy LBASIC 5.1.4 over to your LDOS 5.3 system. Nothing prevents you from using the LBASIC under the new system; unless you are going to try to use the new features!

Hard Drives

TRSHD3 and SET2RAM

Fm Gary Phillips To MISOSYS, Inc: I just acquired a RS 5M hard disk. It's working fine with LS-DOS, but I'm having difficulty getting it to work with LDOS 5.3 and my 4P. Is the SET2RAM/MEMDISK combination incompatible with the TRSHD3 driver? The drive is partitioned into four logical drives of one head each. Heads 1-3 are LS-DOS, with head 1 being a system disk (Adam Rubin's HDBOOT mod installed and working). Head 4 is an LDOS system disk (5.3) using the TRSHD3 driver. I have in high memory under LDOS only TRSHDx, \$K14, and \$TA. I can boot the system from my configuration floppy, which sets up the HD as drive 0, and my two floppies as 5 and 6. All other drives are disabled. This configuration runs fine.

However, if I now install SET2RAM and MEMDISK from the Model 4 Hardware Integration package, a crash will soon follow. One sure way to cause a lock-up is to do a BACKUP SYSS/SYS:0 :1 (S) from the HD to the MEMDISK. It will crash when it starts to copy SYS0. Even if I do not try to build a system disk on the MEMDISK, a similar crash will occur within a few commands. COPY, KILL, TED, and DO have all produced the crash (screen fills with garbage, keyboard locked out, no disks active). Normally the crash occurs at the point where the command has completed and would be returning to DOS. The symptoms are similar to those that occur when something returns to SYS1 after SYS1 has been replaced by some other overlay.

I realize that the memory juggling that goes on between SET2RAM and the HD driver is very touchy. Could it be that they simply can't coexist? Or is it a problem where TRSHD3 writes to what would normally be ROM addresses, thus trashing the system? Or am I missing something obvious? What would you need in order to diagnose this one? (I already have RSHARD on order, so perhaps this is a moot question?)

Fm MISOSYS, Inc: Ah, Another case of not reading the manual. Page 4 (at the bottom) of the HIK manual gives you a patch to TRSHD3/DCT within the paragraph titled "CAUTION". We give you the information; you only have to read it <grin>...

Fm Gary Phillips To MISOSYS, Inc: In case you are puzzling over my TRSHD3 and SET2RAM problem report, let me add that RSHARD arrived today and after reformatting and installing it the problem appears to have been cleared up. Sure makes TRSHD3 look suspect, doesn't it. (I had reformatted and retried a couple of times before writing up the earlier report.) RSHARD has generated a new question, though. I installed RSHARD6 and formatted the LS-DOS partitions first, and apparently I inadvertently typed 154

instead of 153 for the cylinder count. They all formatted and pass through HDCHECK6 with no problem (gee, an extra 24K of space). However, when I went do LDOS to redo the fourth head with RSHARD5, although I specified 154 cylinders, the formatter and driver insisted on accessing only 153 (0-152 are the actual numbers), but they access all 154 on the LS-DOS partitions! Went back and reformatted the LDOS head with RSFORM6 and got 154, and now LDOS/RSHARD5 seem quite happy with it. Is there a discrepancy between the two drivers in the way they determine the number of possible cylinders? Aside to any casual readers: I strongly recommend RSHARD over the TRSHDx drivers. You get smaller grants, use less memory space for the resident driver, and everything still works the same. For the price, it's a real gem!

Fm MISOSYS, Inc: That's a curiosity. I would have to examine the code to double check the possibility for your experience. Since both sets of files are generated from the same code (with conditionals heavily used), I can't speculate on the reason.

After checking the code, I can find absolutely no reason for the effect which you posed. The number of cylinders is determined strictly by your response during the installation of the driver - the first time. My hunch is that you entered 153 when you installed the LDOS driver. Without some more concrete evidence, like copies of the DCT as well as the initialization data stored in the driver, I can't speculate.

Fm Gary Phillips To MISOSYS, Inc: Caught me napping, didn't you? I prowled and prowled through everything I had on the HD drivers and installation, but it just didn't occur to me that the problem would be so clearly stated in the HIK documents (thought I knew everything there was to know about that--and maybe I did, as long as I was running from floppies!) Well, at least I diagnosed the symptoms correctly!

I retried the thing with the RSHARD5/RSFORM5 vs. RSHARD6/RSFORM6 and found that it consistently repeats itself, at least with my drive. Now perhaps other 5M drives won't format that extra track to begin with, in which case it would sure be hard for you to duplicate. Certainly it isn't exactly a bug, since the drive should really only have 153 cylinders to begin with. But in case you have time to waste fiddling around, and a 5 meg drive that's empty (haha), here's the sequence of events:

- (1). LS-DOS 6.3: SYSTEM (DRIVE=5, DISABLE, DRIVER="RSHARD6" ... set up head 1 as a system drive, and tell it 154 cylinders.
- (2). LS-DOS 6.3: RSFORM6 :5 ... this formatted and verified for cylinders 0 through 153.
- (3). LS-DOS 6.3: SYSTEM (DRIVE=7, DISABLE, DRIVER="RSHARD6" ... set up heads 2 and 3 as another logical drive.
- (4). LS-DOS 6.3: RSFORM6 :7 ... again formats and verifies for cylinders 0 through 153.
- (5). LDOS 5.3: SYSTEM (DRIVE=5, DISABLE, DRIVER="RSHARD5" ... set up head 4 as a system drive, and tell it 154 cylinders.
- (6). LDOS 5.3: RSFORM5 :5 ... formats and verifies ONLY for cylinders 0 through 152 even though RSHARD5 accepted 154 as total count.
- (7). LDOS 5.3: SYSTEM (DRIVE=7, DISABLE, DRIVER="RSHARD5" ... will bring the LS-DOS partition on line and FREE or DEVICE shows 154 tracks on drive 7, but only 153 on drive 5!!

Fm MISOSYS, Inc: A lot of folks appear to be napping these days. I should take a rest myself. I can just hear the phone ringing on January 2nd.

RSHARD

Fm Dave Krebs To Misosys: The RSHARD package just arrived and I spent the evening re-doing my 5 megger. I have one small accounting package (GL) that I have to run on LDOS 5.3 (the rest on LS-DOS). I originally purchased the package 'cause it offered partitioning by head and/or cylinder. I wanted to partition head 4 into 2 logical drives for LDOS. I was really surprised when I finished the job with RSHARD6/RSFORM6 and found out the gran size was 1 K. That's smaller than a floppy! You returned about 40 K of disk from my /JCL's alone! A rough estimate is that I gained 15% of usable disk space because of the small gran size.

By the way, I didn't see your warning about re-formatting (pg 9) BEFORE using the DEVICE command until it was too late! It's a habit, I guess, I want to see if the config I just set is really what I want. That sure fixed things up and I spent about an hour doing it over. I'm not blaming you for a lack of a warning ... it was there. The procedure looked so much like the ones I've done many times before with TRSHD6 that after skimming thru the DOCS, I forged ahead. Maybe it would help us "skimmers" if the warning was on pg 1, I doubt it. Thanks for the extra disk space.

Fm MISOSYS, Inc: We'll consider that for a README file. It reminds me of the classic test which was given in school. The teacher handed out a sheet with about 20 instructions. The first was read the entire quiz before doing anything else. Questions 2-19 asked you to do all sorts of things (like stand up, repeat out loud..., etc.). The last question (statement) said, "now that you read the whole quiz, turn the paper over and do nothing". You'd be amazed at how many folks were doing all of the stupid things.

Fm Ray Pelzer To Roy Soltoff: I always wondered about that... if you did #20, doesn't that mean you FAILED parts 2-19 by NOT performing them first? After all, the way that test was worded (somebody showed me a copy once), you were to turn the paper over and do nothing AFTER all the other parts were performed.

Fm MISOSYS, Inc: No, you were to turn the paper over after completing the first question which said "READ the entire test before doing anything". The last question was something like, "Now that you have read the test, do nothing further..."

PROFILE III+HD

Bug in EFC9 module

Fm MISOSYS, Inc: Bill Peake brought to my attention a problem he was having running PROFILE III+HD under LDOS 5.3. According to him, he did not have the problem

under LDOS 5.1.4. Essentially, when he tried to access record 398 of his 500 record data base while in the Inquire/Update/Add module after accessing low-numbered records, unpredictable behavior would result - primarily a program crash of one form or another. Based on his report, I expected to find an error in release 5.3 LDOS. Thus, I asked Bill to forward a complete set of disks to us.

Sure enough, when I attempted to duplicate the exact sequence of steps he reported, PROFILE crashed. Next, I decided to confirm correct operation under release 5.1.4 of LDOS. Fortunately for me, that crashed after the same sequence of steps. By now, I was intrigued with the problem, even though it did not appear to be caused by the DOS. I decided to spend some time and root out the cause of the program crash.

I next copied his data files over to my hard drive and repeated the test. This time, it worked correctly. Back to the floppies, I soon discovered that because of the size of his data record and number of records, the two data files making up his data base each took five directory extents; thus, the files required an extended directory record. Not only that, but the file position of the fifth extent was exactly the location of record number 398! Now that was intriguing.

If you understand the file access system of the DOS, you will know that the file control block for an open file holds information on at most four directory extents. Furthermore, LDOS must use SYS8/SYS to locate the information on a directory extent not currently contained in the FCB. So in order to access record 398, the DOS has to access SYS8.

The only thing left to do at this point was to disassemble PROFILE's EFC9 module and trace through the access operation. It was at this point that the cause of the crash was discovered. PROFILE's EFC9 module sets the stack pointer to 409FH! That region should not be used by application programs; it's in the area reserved for DOS! The stack usage of the module coupled with the stack usage by the DOS with the additional stack usage required to bring in SYS8 exceeded the *safe* size of that DOS region; the result was a wipeout of a critical area of the DOS. I confirmed this by revising my high-memory configuration reserving the top 256 bytes for a stack area, patching an X'FFFF' into the EFC9 module at address 7B75H. Sure enough, duplicating the reported sequence of steps provided correct operation of the update module.

I provided Bill with my analysis and gave him a method to temporarily deal with the problem by using the high memory for a stack area. I also discussed my results with 5.1.4 and was able to learn that the data files used therein were only four extents; that's why he had no problem with 5.1.4 LDOS. Armed with my results, I referred the problem with its cause to Norma of the **Small Computer Company** at their technical support number (914-769-2150). This was in mid-November 1987. I requested their resolution of the problem. As of this writing (mid-February), I have had no response.

LS-DOS 6.3

LS-DOS and Model 4 Information

Warnings

Warning on CRTSAV/FLT

Fm Jeffrey Kline: Warning! Do not use the program from 80 Micro here last month herein referred to as CRTSAV/FLT. This appeared in the October 1987 issue of *80 Micro* as source code for a screen protection filter that would mute your screen after 3 min. of no activity. It appears that it does a lot more than mute your screen! I lost a whole drive full of files because of it. Basically, when I did a backup of files from my hard disk using the DOS's backup utility, it went through all the motions. Then after I was finished, I didn't think to go back and check to make sure the files got where they were supposed to go, so I went ahead and formatted the hard disk partition losing all those files. The program appears to screw up not only backup, but also causes programs such as LeScript, Allwrite, the entire ALDS package, XTerm4, FastTerm, and many others to not save files when performed, and also manages to screw up your normal display of programs after the 3 min. timeout. This filter is bad for your system and your health! I have not had time to look at the source code but my copy was compiled from the listing in 80 Micro as it was! So be warned. You can also find it on the Load 80 disk as "CRTSAV/ASM" and "CRTSAV/FLT". I also find that it will not SYSGEN correctly. In fact it corrupts the CONFIG/SYS file that goes on your system disk. The next time you boot, you get random garbage on the screen and any other filters or drivers never reach their destinations and install.

If you need a filter, use one called SCREEN/FLT that I have seen here in the DL. If it is not here, then I can upload it. I have used it extensively for over 2 years now with no problems at all. It's only drawback is that it times out after 2 min.

Model 4 DOS Date Command

Fm Scott Burnham: I seem to be having some trouble with my date command in my TRSDOS 6.2. It seems that 6.2 is only able to accept dates up to the end of '87, or at least that is what the DOS manual says. I still need the date to keep all of my files in order, so I can't just toggle the date prompt. Also, putting the real date in after I do an '87 date doesn't work. Is there some way that I can get it to accept dates after '87? Or would that require something below the language level? Your help on this would be appreciated.

Fm Jeff Brenton To Scott Burnham: I have to ask - where have you been this last year? There was a limitation built into the directory structure of all TRS-80 DOSes from (almost) day one, when it was decided to encode the date into 3 bits. 3 bits give you a range of 8 years; starting with the base year of 1980, that means 1988 can't be encoded using this scheme. Changing the scheme means modifying the directory structure.

Late last year in 1986, both LSI and Misosys started advertising the ".3" series operating systems, which takes away one of the file passwords and replaces it not only with the date through 1999, but also the modification TIME. LSI sells LS-DOS 6.3, which replaces TRS-DOS 6.2, and MISOSYS sells LDOS 5.3, which replaces 5.1.4 as the current release of the model III operating system. Both have been available since January '87, and Radio Shack even mailed out notices of where to by LS-DOS back in mid-summer, to registered owners of 6.1 and 6.2.

The changes made, and the added capabilities put into both versions, have been a major topic here for over a year, and there have been several articles in 80Micro about it.

Upgrading to 6.3.0

Fm LSI: You can upgrade directly from 6.1 to 6.3, but... Because of the changes in the disk format between 6.1 and 6.2, there is a slight modification to the regular updating procedures.

Actually, it is only a change to the unstated, but obvious, first step of making a backup copy before beginning to update. The new DISKCOPY command is very handy for making a backup copy to update, but that is what should NOT be done when going directly from pre-6.2 to 6.3. Instead, FORMAT a fresh disk with 6.3's FORMAT/CMD and then use BACKUP to move all of the files over to the new disk. Since this is the natural thing to do anyway, no big deal is made about it.

6.3 handles pre-6.2 disks that have not been DATECONV'd just fine. It does not maintain the date and time fields, though.

Fm Gary Phillips: Don't give up on LS-DOS 6.3. I'm running it on a hard drive with no problems whatsoever, and

so are a lot of other folks. When setting up drivers and devices, you need to be VERY meticulous. Plan out everything you are going to do and WRITE it out in advance. Go over it and make sure it matches the instructions and your environment. Do NOT hurry (do NOT pass go, do NOT collect \$200) and instead be very sure that you understand each step. Check them off as you perform them, starting with a full backup of your drive. Giving the wrong reply to a prompt can easily trigger the sort of disaster you described. But there is nothing inherent in 6.3 that would make it "go crazy" when 6.2 does not do the same thing. A lot of us here can offer help if you have a problem, but we would need a detailed step-by-step explanation of what you did and what the results were before any understanding is possible.

6.3 Site license

Fm LSI: For REGISTERED owners of LS-DOS 6.3, we have a reduced price for the "SITE" license of \$60.00 U.S. It does not matter whether you had bought ten copies at \$39.95 each or only one at the introductory price of \$29.95, the site license is still 60 bucks. We did it this way because it would be too much hassle to try to verify the actual amount paid in all cases.

No, it doesn't do you any good to get a site license if you have only two model 4s and already have two copies that are "keyed" together. This is another reason for the above price policy. If you are getting more model 4s, you probably would rather get a site license rather than 2 or more additional copies of LS-DOS 6.3.

Tandy bought 6.3 disks ONLY from us to put with the 4Ds. They were allowed to use our documentation or write their own, but they had to print it themselves. They just rewrote ours. Why they did not include registration cards is a mystery to me. Apparently, Tandy is not maintaining registration records for LS-DOS 6.3, even though they DO support it, but LSI is (as fast as I can type). I am happy to add those that got 6.3 from Tandy to our registration records. For that, I need a letter, some form of proof-of-purchase, and the Customer Service ID# (of course). I will also "key" copies of 6.3 that you got from Tandy together with ones that you got from us, for no charge. Just send all of the beige LSI master disks that you want keyed together to LSI. Again, there is no charge for "keying" your 6.3s together.

txp/cmd and ERROR 2b

Fm Joshua to --jjkd--: When entering using the TXP with a filename, I get an error - it comes up with "Error 2b" - is this normal?

Fm --jjkd-- To Joshua: Error 2BH is a SVC parameter error. The most likely causes are that the system you booted with is not 6.2 or newer, and TXP requires some of the SVCs that were added with the 6.2 release. Note that if you buy the upgrade to 6.3, one of the things that comes with it is a text editor.

Forgotten passwords

Fm Anthony Waits: Several years ago, I wrote some BASIC programs, when I was in electronics technical school. These were written on a Model 4 with TRSDOS 6.0 I think. Anyway I used the ATTRIB function to protect the files with passwords I could relate to then. Thanks to an unreliable memory and the fact that I did not own a computer at that time I can no longer remember the passwords. I would now like to make some changes in these programs and am now restricted from doing so. I remember when I was using an older Model 1 that there was a universal password that could unlock files when a user forgot these passwords. Is there such a password in TRSDOS 6.2 or even 6.0 (I still have a backup of the SYSTEM disk that I made back then). Please reply in confidence to my EMAIL address with the password, or here with other possible help.

Fm MISOSYS, Inc: Enter the following command from TRSDOS Ready:

MEMORY (A="N",B=128)

Thereafter, you have full access to all files with total disregard to passwords.

Running faster...

Fm Mark Mueller To MISOSYS, Inc: After a week, no further problems have developed now that I DATECONV the RAMDISK after formatting. Gotta use the "CS" parameter if no files have been put there, but since it's in a JCL it's no problem.

I have run into an interesting phenomenon with my 4P running full-tilt: the floppy drives (TEAC double-sided 1/2-height) can't get running fast enough sometimes and a "file not found" or "no disk" error message comes back. Turning on the delay (1 sec) fixes it. I wonder if the fast speed is causing a timing loop to not wait long enough for the drive to get up to speed. Actually, since that is a LS-DOS question, LSI should have gotten it, but maybe you would be interested.

Fm MISOSYS, Inc: The delay after motor on is 0.5 seconds (in OFF) based on the time delay introduced by an @PAUSE svc call. Now if the machine speed was altered from the expected, then @PAUSE would be incorrect. If, for instance, you were running a speedup mod or an XLR8er, then you may find that @PAUSE does not pause for as long as it should. This could be the answer. Changing DELAY to 1.0 seconds could fix that up. If you are sure of your 4Ps speedup, if any, you could probably twiddle the value of the delay in the FDC driver to compensate for the speedup effect.

Fm Mark Mueller To MISOSYS, Inc: Thanks for the info. I suspected it was a software loop. My 4P running an XLR8er at full speed is too fast for the drives with the delay off (sometimes it manages to write a duplicate file with the same name on the same disk! Thank Ja for time stamps!!) and usually returns a "drive not available" error. I set both floppies to DELAY=ON and sysgened it and have had no further

problems. Since fiddling with the driver makes me nervous, I think I'll just live with the system commands.

Fm MISOSYS, Inc: LS-DOS 6.3 (as well as 6.2) uses a countdown timer in the @CKDRV routine which is thus machine speed dependent. It used to use the interrupt timer counter which was machine speed independent. I believe LSI changed to the countdown loop because they wanted to avoid problems with enabling interrupts in @CKDRV, although I was not a part of that operation at the time it was done. You may also want to adjust the counter values in SYS2. Perhaps one day I'll get a chance to evaluate that. The next TMQ [this one -ed] will have some DOS patches to enable use of the 64180's MLT routine for @MUL16, @MUL8, and a SVC call in the video driver. That should speed up some more activities. I also have a revised FIXBANKS module that was submitted to me which uses only 185 bytes of LOMEM in lieu of 246 as used by FIXBANKS. It separates out the initialization stuff to HIMEM and optimizes some of the required LOMEM bank handling code.

sys6/7/8/sys libraries

Fm Kevin R. Parris To MISOSYS, Inc: I started on this subject several weeks ago. PRO-PaDS will not do anything with SYS6/SYS. PRO-CESS docs say "no maintenance can be performed" on the system libraries. What is the program that DOES perform maintenance on the system libraries? In particular, I am interested in making them smaller, to leave more space available on some special-purpose disks. I have PRO-MRAS; it has often been said that LDOS/TRSDOS6/LSDOS is assembled using PRO-CREATE (I think), anyway, something that I am not familiar with. After being assembled, what is used to put the libraries together (the same thing that is the answer to my first question, probably!)?

Fm MISOSYS, Inc: Nothing is available to perform "maintenance" on the system libraries. The only thing you can do with the tools which you have is to use PRO-CESS to extract every library member then build your own PaDS library of whatever members you want. Then PURGE the system libraries. Since there is an extremely close relationship between the library file construction and SYS1, it was never deemed practical to offer users a method to organize their own libraries. It was also considered that to do so would cause further problems when patches to the libraries were issued. We ourselves have only had a few requests for such a tool over the years. Certainly never enough to justify the tool. Internally, we use a special program to construct the system libraries. The program is nothing special; most assembly-skilled folks could write one themselves. But one has to pre-construct the tables and correlate the table in SYS1. That's not as straightforward as it looks.

Real-Time Clock

Fm Jim Beard: How do I get to the 60 Hz clock in the Model 4? The \$TIME svc docs say nothing on this. I would like to get at an assembly language routine that could be used from RATFOR as a timer utility. This is a final touch to 2.0, which has seven new keywords, command line parsing with GETARG, a "profile" filespec specified on the command line, etc.

Fm MISOSYS, Inc: You could install your own task in slot 12 to be the ticker. Slot 12 is the only one which is strobed at the fast rate. That method would be the "cleanest" as it is a documented interface. Anything else would require you to be twiddling with the interrupt handler code which would not be so elegant.

Background Task

Fm Kevin R. Parris To MISOSYS, Inc: Unless I have overlooked it, "The Programmer's Guide" does not explicitly address this issue: is a background task (that has been identified to the system by the @ADTASK SVC) permitted to execute the EI instruction? Personally, I would think not. Also, what is the state of the interrupts when the task receives control? That is, if it has something to do that must not be interrupted, does it need to execute the DI instruction? One more thing: What range of RAM addresses 'disappear' when the 4/p boot ROM is switched in? The memory map diagrams in the Tech Ref show the ROM as 1K, and all RAM available in the rest of the addressing range of the machine. The reason I ask these questions is that I wanted to make the SMARTWATCH update routine, by Duane Saylor, reside in LOWCORE instead of above HIGH\$, but it just will not work down there; system either freezes or re-boots itself every time. The original code disables, then enables, interrupts during the time it is reading from the SMARTWATCH. I have begun to suspect that maybe everything below x'4300' "goes away" when the boot ROM comes in, since that is the address the boot code uses to save things. Thanks for your time and support.

Fm MISOSYS, Inc: Don't do an EI in an interrupt loop. The machine state is interrupts disabled during the entire time within the task processor. That's the function of the interrupt processing in the Z80 to begin with. I believe you are correct about the 4P boot ROM; it is 1K, although the addresses don't completely disappear - they can be written to which is how low RAM is populated with data while the boot ROM is engaged. See Adam Rubin's article in this issue of TMQ. Without knowing exactly what and where you are trying to load, I can't guess at what the crash is due to.

Drive "Sleeping"

Fm David Huelsmann: I think I may already know the answer to this question but, there are a lot of hardware experts here who may have an easy solution. On my 4d, physical drive 1 has started a trick lately of falling "asleep" during access. That is, the drive will spin, the light is on, but no data transfer is occurring. Opening and closing the drive door latch will "fix" the problem for a very short time.

I suspect several things: (1). Drive cable connection "flakey". (2). Alignment problem. (3). R/W head dirty or pads worn down. This is a DSDD drive. Any guesses from the "experts"?

Fm MISOSYS, Inc: Suggest you try to use the SMOOTH parm of the SYSTEM command. If you don't have SYSTEM (SMOOTH) turned on and the drive speed is "precisely" 300 RPM, then it will exhibit that behavior. Solution is to use SMOOTH or to adjust the drive speed to about 301 (if adjustable).

Fm --jjkd-- To David Huelsmann: Do you have "smooth" on or off? If on, there is likely a problem with the hub clamping mechanism or index pulse sensor/output. If off, you need to adjust the speed of the drive slightly away from 300 RPM, like 301.5 or so. Spec is ± 4.5 RPM, so that is well within normal tolerance. If you don't have a drive timing program, try Jim Beard's handy trick of looking at the drive spindle flywheel strobe disc under a fluorescent light, and adjust so that the "image" makes a lazy rotation once per minute (like a sweep second hand).

Fm David Huelsmann To MISOSYS, Inc: Hadn't thought about that! Been in use for over a year without SMOOTH (cause I like the type-ahead) and just assumed a drive problem had recently occurred. Could have degenerated speed adjust downward just enough I suppose. Will try SMOOTH before I tear everything apart.

Fm MISOSYS, Inc: Adjustable speed drives do change speed with the aging of the components. That's why they have a drive adjustment screw. Some newer types have a phase locked loop mechanism to internally keep their speed constant.

Fm David Huelsmann To --jjkd--: Since I have been operating without SMOOTH for over a year, I had forgotten about it! Will try that first, if problem goes away, then, will adjust RPM slightly off (fortunately, this is an inboard drive and adjustable - outboard ones are not).

Fm David Huelsmann To MISOSYS, Inc: SMOOTH solved the problem so the drive definitely "aged" downward some. Will be readjusting in the next week so that I can retain type-ahead.

Fm MISOSYS, Inc: Now if you had a hard drive, SMOOTH wouldn't have been needed <grin>. Glad to help out. Both LSI and MISOSYS took a lot of heat about the issues of drive speed and our floppy driver performance. That's why SMOOTH was added. But you see, you want to turn it off so you could regain useful type-ahead. That's why the floppy driver was designed as it was all along.

FORMAT/CMD of 6.3

Fm Alan Varga To LSI: I am running LS-DOS 6.3 and have tried reformatting some old disks no longer being used from 6.1 and 6.2.1. I am getting lots of bad cylinders when I run FORMAT and the verification process begins. As I recall, I had a problem with Format Gaps when I upgraded to 6.2.1. I called LSI in Milwaukee at that time, and you said there was a patch which Tandy requested be included, but which you didn't think was particularly necessary. I was told to delete the patch from the JCL upgrade file, and I had no trouble after that. Am I having the same kind of problem again, or are my drives out of alignment?

Fm LSI To Alan Varga: Yes, I am afraid that it probably is the same kind of problem. It could be any of a bunch of other thing, too. But if your computer had trouble with the GAP of 6.2, it will be the same with 6.3. Unfortunately, this time it is not as easy as just deleting a patch. I would like to check with Bill before making any

recommendations for the long term and he is not available for a few days. Here is a kludge that should get you by for a while. Use the 6.2 Format command that you were using before, and then DATECONV. Let me know how that works. If it doesn't help, we may be barking up the wrong tree.

Fm Bob Haynes To LSI: Huh, a quick look shows the 6.2.1 upgrade JCL does contain the new gap code; guess Alan has already been exposed to it. Was your reply an indication there might possibly be a problem with OLDER machines under the NEW code? Guess we'll have to wait till Bill gets back.

Fm LSI To Bob Haynes: Thanks for pointing me to DSKFMT.TXT. I never was aware of those details before. Just that some model 4's require a different GAP. Apparently, that does not include very many that are still in service, or I would have heard a lot more about by now. We are still waiting to see if that is what Alan is running into or if it is something else. Yes, the problem that Joe deals with in DSKFMT.TXT is exactly what I was thinking about. I will lay all of this on Bill tomorrow.

Do you need me to indicate that there might possibly be problems with OLDER machines under ANY code? I have suggested to Bill that we raise the price of LS-DOS 6.3 to \$149.95 and include a FREE disk drive, but he thinks I am joking. It sure would cut down on the customer support calls though -- he probably wouldn't even need me any more -- FORGET IT. It was a bad idea. Never mind. Of course, all of this may have nothing to do with Alan's problem. I wonder if he has picked up my reply yet.

Fm --jjkd-- To LSI: All old machines should be able to run the old and new gaps ok. All new machines (with 1773 vs. 1793) may be flakey with the old gap. All machines can have a problem with the new gap if the drive speeds are off by too much.

Fm Bob Haynes To Alan Varga: Not to belabor the obvious, but is your format problem occurring with more than one drive? If not, it's gotta be the drive itself. If so, with a non-gate array M4 with a stock RS controller, your controller board may need adjusting. Does the format tend to work OK up to a certain cylinder # then fail miserably after that? Marginal adjustments become more critical as the write head moves closer to the center of the disk (higher cylinder #s).

Those 6.2.1 format patches have worked quite well for an awful lot of non-gate array users, which makes it sound like yours may be a previously marginal hardware problem that is now starting to go critical. (I know, BIG help I am!) Food for thought, though.

Fm Alan Varga To LSI: Virgil and Company, many thanks for all of your messages. I read your original reply a couple of days ago but didn't get a chance to try out your suggestion until just now; I had to hunt for my copy of 6.2.1 and blow off the dust. That FORMAT program still works but DATECONV didn't change BOOT/SYS and DIR/SYS -- I guess I have to put some REAL files on the disk first. The disk I used was not virgin and was not bulk-erased, but I didn't come up with any bad cylinders, so I'm convinced that the

problem wasn't due to bad media. I had a friend tear my machine apart with me when I was looking into adding another 64K memory chip from Jameco and he determined that I have the non-gate array version of the Model 4. Any suggestions for a permanent fix? Can I copy my existing disks onto newly gapped disks once we get past the cylinder errors?

Fm LSI To Alan Varga: Suggestions for a permanent fix? How about getting a new drive? OK OK, forget it. Just kidding. Seriously, the next step would be to check the speed of your drive. If it is running a little fast, 304 RPM or so, and with the GAP longer now than in 6.1, the end of the track may be too close to the beginning. That suggests two possible solutions: slow down the drive or shorten the GAP.

If you slow the drive down, will you still be able to read your disks? I don't know if that will be a problem or not. (I request others to chime in on this point, please.) BTW, Radio Shack used to recommend that the drive speed be set a little on the high side to avoid an occasional long delay in drive access that resulted from a near synchronization (sp) of an interrupt with the disk. The SMOOTH option, that was added with 6.2 corrected that problem by turning interrupts off during drive access.

As for shortening the GAP, sure! Can do. But it will take some time to get a patch and appropriate instructions for "tuning" it put together and tested. When we do get it ready, it will probably come to you from --jjkd-- rather than from me or LSI, directly. Otherwise I will be explaining for the next six months that "yes, we did the patch but no, you don't need to install it because it is just for a particular and unusual hardware problem".

I will be gone for a few days and maybe someone else will come up with a good idea in the meantime. Let me know if you want us to get to work on that patch.

Fm Jim Beard To LSI: Make a special tool with a few parts from your Radio Shack store. A line cord, a NE-2H high brightness neon bulb, and a 2.2K (red, red, gold) 1/2 watt resistor are what is required; in any case, the best resistor value is recommended on the back of the bubble pack containing the NE-2H bulbs, if you get them from Radio Shack.. Solder the resistor to one lead of the NE-2H and tape it with plastic electricians' tape. Solder the line cord leads to the remaining two leads (one to the NE-2H, one to the resistor) and tape them. Your disk drive will have a strobe disk on the bottom; plug in your new tool and hold the light up to it. You can adjust the drive speed to exactly 300 RPM. If the entire strobe disk seems to rotate about as fast as a clock sweep hand in the direction of disk rotation, this is 301 RPM.

Fm Alan Varga To Jim Beard: Jim - thanks for the tip on building a drive-speed checker. I have to try another RS store; the one near home is out of NE-2H bulbs. Since I am a BASIC programmer and not a hardware hacker, how and where do I hook up the line cord once I have my MOD4 box apart? My machine has 2 drives. Are they both driven by the same motor? How do I know when I have slowed them down too much if they were initially set on the high side per message 86804? I would like to be able to read all of my current disks. If the two drives can be adjusted independently

maybe I could fix one and copy disks one at a time from the fast drive to the slow one and then fix the other one. Is this feasible?

Fm MISOSYS, Inc: Another thing that can be used for a drive speed checker which requires absolutely no construction is a fluorescent light.

Fm Alan Varga To LSI: If the problem is the drive speed I would rather adjust it to conform to standard specs. I don't want to own a one-of-a-kind computer that can't write disks readable by other nominally affiliated machines. Thanks for offering, but for now I'll pass on having a custom patch.

Fm Alan Varga To Bob Haynes: You're not belaboring the obvious, but I may have overlooked the obvious. So far I've only tried formatting a disk in drive 1; I will try formatting one in drive 0 and let you know what happens. Since I am a BASIC programmer and not a hardware hacker, I need some help. How does one adjust the controller board? Can I replace the 1770 chip with a 1773 or will I cause more problems and render my current disks unreadable in the bargain? I really want a "standard" M4 but I have quite a few disks which I don't want to trash.

Fm Bob Haynes To Alan Varga: Well, Alan, any suggestions would be based on the results of a drive 0 format, so I'll wait for that. If you have success, you can backup those questionable drive 1 diskettes with DISKCOPY :1 :0 commands, then you can deal with the hardware problem without worrying about losing anything.

Meanwhile, don't let my comments re "gate-array" vs "non-gate array" bother you. It's just a matter of when your machine was manufactured; the "mother board" was totally redesigned, but the change was pretty much transparent to users and programmers at all levels except maybe assembly on occasion. As a matter of day-to-day use, they're virtually identical.

If you do not maintain an intimate loving relationship with silicon chips (as in hardware hacker - <<grin>>), do not even think about fiddling with any chip replacement or controller adjustments! That requires availability of and experience with certain test equipment you likely don't have. Let me know how drive 0 format goes first.

Model-4 <=> MS-DOS

Z80 emulator for PC

Fm Donald R. Arrowood: I've picked up another emulator over in the IBM area at IBMSW in DL 1 called z80mu3.arc and I'm going to give it a try, the info on it is mostly on CP/M.

TRSCROSS Question

Fm Sam: I have tons of data files that were created on my Model 4 under TRSDOS 6.1 and 6.2 that I would like to get into IBM-PC format. I am planning to use TRSCROSS for this purpose, but have a couple of questions I'd like cleared up before buying TRSCROSS. Although I've had no trouble in transmitting any text files via modem to CompuServe or other desktops, I have not been able to transfer these particular files. They are simply data files, but the logical record length is 106 bytes in one and 9 in the other and I get a LRL error from both DeskMate and Vidtex when trying to transfer these files. My main question is, will I have a similar problem with TRSCROSS? It sounds like the program is designed to do exactly what I want, but I'd hate to spend 90 bucks to learn otherwise.

My second question is, the ad from Powersoft mentions "PC" and other ads for TRSCROSS mention the 1000's, but my "easiest access" is to an IBM PC-XT. I don't expect any problems, but would appreciate knowing before trying to use this machine if it will not work.

While I'm at it, does anyone have any comments or suggestions regarding the LRL problem I have when trying to transfer these files with my present software? I've also tried to upload the files to CompuServe, acting as a terminal to their mega-computer and get the same LRL error. Some of the files I need to copy exceed 100K, so I can not re-field the records and copy to a file with LRL of 256 as it would exceed my Model 4's capacity.

Fm MISOSYS, Inc: You would have no problem as LRL is irrelevant for PC. An intermediate solution would be to change the LRL. You can use COPY to copy the file to a new file; use CLONE=NO,LRL=256 as parameters. Or you can zap the directory record with FED - providing the current application using those files won't mind.

Fm Sam To MISOSYS, Inc: I'd have no trouble making the records 256 bytes and changing my software, but the file size would then be about 256K and I've got "stock" 184K drives.

Fm MISOSYS, Inc: That's not what happens. The file size does not change. The LRL maintained in the directory has nothing to do with altering a file's size. If your application uses the directory's LRL for the data record length, then zapping the DIR will make the data unusable in the application. On the other hand, using COPY to create another file with the same image of data at LRL=256 will permit you to send that file. Clear?

Fm Les Mikesell To Sam: Using COPY (LRL=nn) will not re-block your logical records to the new size, it just changes the record length field in the directory entry on the copied file. When a program OPENS a file, it must explicitly request the LRL anyway. If a file is OPENed with a different LRL than what is specified in the directory, an error is generated (under 6.x, not 5.x) but it may be ignored and everything will work fine. Many programs (and languages) do not bother to check why the OPEN returned an error and just give up.

Fm --jjkd-- To Sam: If you use COPY to change the LRL, the same number of bytes will be used total. You specifically do **not** want to pad each logical record to 256, merely change the LRL so that the terminal program doesn't barf.

Fm Sam To MISOSYS, Inc: It's painfully clear now, as you are the 3rd to kindly reply with the same explanation. I'll definitely try it. Not that I want to deprive you vendors of any well-deserved money, but If I can xmit the files as they are, it will be free. I appreciate all the help! If I don't go MS-DOS, I'll also be calling to subscribe to your *QUARTERLY*, to keep me straight.

Fm MISOSYS, Inc: Don't forget, we also carry MS-DOS products. Will have an Accounting package available soon - Bedford Integrated.

BASIC

BASIC & Attrib

Fm Dave Spiceland: Is there a way to change the name on a disk from BASIC? I tried: SYSTEM"ATTRIB (NAME="NEWNAME") and it aborted. Any way to do it?

Fm Stephen Sutherland To Dave Spiceland: The problem is that your system command sees the quote just before the NEWNAME as the end. This line will solve your problem.

```
10 A$="ATTRIB :0 (NAME=" + CHR$(34) +
"NEWNAME" + CHR$(34) + ")"
20 SYSTEM A$
```

The CHR\$(34) will insert the two quotes around the needed name change. Also, you can substitute variables for the drive number and the new disk name.

Mod 3 to 4 conversion

Fm Louis Self: I need to convert BASIC programs from Model 3 mode to Model 4 mode. I have heard of software out there to do it. Where can I find the best program?

Fm --jjkd-- To Louis Self: You are referring to converting the code itself, such things as PRINT@ to LOCATE, etc., right? If so, the best I know of is (strangely enough) Roy's combo of BSORT/MOD324. That gets you a general purpose sort routine plus the conversion program for BASIC. A bargain at \$25 or so. There are a few shareware/PD programs for this floating around, but I haven't seen one yet that I would trust my programs to for the difference between downloading time and a paltry \$25.

Fm MISOSYS, Inc: BSORT/MOD324 has been re-introduced at the unbelievably LOW PRICE of \$14.95 + S&H.

Late delivery

Fm Kevin R. Parris To LSI: I delayed until 21 December sending my order for LS-DOS 6.3, and was worried that I might have to put up with running back-dated for a few weeks waiting for it to arrive, but you have delighted me greatly. The package arrived ten days later, on 31 December, just in time to allow me to keep everything on "current dates". I have a question about the "question and answer" section, page nine, on the question "Why can't I edit out". The answer starts with 'Or you may be getting "EDIT" or . . .'; my question is: What was supposed to be in front of the "OR"? It sounds like a sentence was left out, that should have been the "object" that the 'or' refers back to?? Just now, as I was typing this, and looking back at the page again, it occurred to me that perhaps the "LIST OCATE" in the question is the antecedent for the 'Or' that starts the answer. Please clarify. Also, it has just dawned on me what the "problem" is that provoked that question, but your answer does not point it out (at least not bluntly)-- the user has attempted to load a program written for PC/MS/DOS (with the LOCATE keyword) into the LS-DOS BASIC system. I had been wondering what in the world is "LIST OCATE", and why is it in that guy's program?? but just now figured that out, too. Funny how explaining your problems to someone else frequently gives out the solution; the real problem is failing to analyze things fully, and explaining it forces a full analysis. One more thing- does my CS# necessarily indicate how many copies of LS-DOS 6.3 have been shipped to date?, and does the Serial Number displayed during BOOT bear any hidden bits of information?? Thanks for your time and attention.

Fm LSI To Kevin R. Parris: You've got the basic idea. The "LIST OCATE" is an example of the way that the first letter command expansion system will expand that letter to the specified command if what follows it does not create a valid model-4 keyword. as "LOCATE" is not in the model-4 basics' keyword table, the "L" will be expanded to "LIST". The CS# is created to tell us several things about the disk and does not have a ONE to ONE relationship to units shipped, however there are no two CS# that are the same. Yes the Serial # at boot contains a whole bunch of info. The actual production unit number is encrypted in there as well as several other things. DO NOT tamper with these numbers!!! Your system will fail if you do!!!

BASIC Files= default

Fm Kerry Wilson: Anybody know the location to patch in BASIC to default the number of files to 5 instead of 3?

Fm Adam Rubin To Kerry Wilson: I haven't tested it exhaustively, but for the BASIC with LS-DOS 6.3, changing X'841A' from 03 to 05 seems to do the trick.

Fm Kerry Wilson To Adam Rubin: Adam, I apparently forgot to thank you for the 'zap' you gave me to change the BASIC defaults. It seems to work fine. I tested it by checking the memory size after loading BASIC and the BASIC (F=5) and just plain BASIC (after the zap) had identical memory sizes.

Model 4P

MODELA/III strikes again

Fm Tom Maurina: I am having a problem with a client using a Model 4 and Videotex software. The software will boot up fine using the Model 4 but when we try to get it to boot up on a Model 4P we get an error message saying "ROM image is not found on Drive 0". I was told that the Model 4 has some basic information in the machine the Model 4P does not. I assume copying a certain file from TRSDOS onto the program disk will allow one to use that same disk for a Model 4P.

The problem is that I don't know what file to copy or for that matter the syntax to use to copy it. Does this make any sense? If so, I would be grateful for an idea how to fix this.

Fm MISOSYS, Inc: The ROM Image is in a file of the name, "MODELA/III". This file must be present on the Model III DOS BOOT disk in order to be able to boot it on a Model 4P. That file is supplied on the DOS disk of every TRSDOS 6.2 and above. Just copy it from the DOS 6 disk to the Model III disk in use for the VIDTEXT. I have to assume that it is on a Mod III system disk because that's the only time the 4P needs to load the ROM Image file.

Fm --jjkd-- To Tom Maurina: Roy has got you covered, the MODELA/III file is the missing critter. You will find this file on an original TRSDOS 6.2 diskette, and note that the file is probably invisible, but can be moved via a simple COPY MODELA/III:0 :1 or equivalent, depending on which drives the diskettes are in.

Memory Usage

pfs:FILE and PRO-WAM

Fm R. H. Hollenbeck to MISOSYS, Inc: After using PRO-WAM for the past few months, I thought it was time to let you know of a small aggravation I have encountered. This is by no means a "trouble-report"; just a short informal report that may help you in the event that someone else reports a "problem" in the same area.

I have been using pfs:FILE as a data base ever since I got my Model 4 in early 1984. You may/may not be aware that as supplied, this application is "backup limited" to five copies. Because of various reasons (none of which is even remotely involved in piracy), I chose to zap this feature. I can now put FILE any place I desire.

I'm running a 5 meg hard drive and PRO-WAM is invoked from a start-up JCL, along with three diskDISK files and some other goodies. When I call FILE, it loads and runs but the prompts it shows are incorrectly displayed (all over the

screen). In order to use FILE, I must go through the following sequence: (1) Normal boot-up to include the start-up JCL. (2) Remove PRO-WAM. (3) Call FILE.

If I forget to remove PRO-WAM before invoking FILE, and remove it after calling FILE (memory is freed up ok), FILE still will not display its prompts correctly. I have to re-boot and follow the sequence just described. This is only an aggravation - most likely caused by me when I fiddled FILE's limited copy scheme (or by FILE's untidy use of RAM) - and I can live with it! Just thought it appropriate to let you know so that if some other PRO-WAM user reported a similar situation, you'd be aware that it was not unique.

Sure wish Little Brother had been available sooner! Keep up the good work.

Fm MISOSYS, Inc: Concerning PRO-WAM and PFS-File interference, you may want to re-evaluate your operation. I did a quick test here and had no problem invoking FILE with PRO-WAM installed. I also had SYS1 resident. PFS-File is big; it loads to X'B1E1'. Double check that HIGH\$ wasn't near that value. I don't know what you diddled to circumvent the "file protection scheme"; perhaps you can go back to the master disk (write protected) and try that. I just didn't get any strange behavior when I invoked FILE; everything was normal.

By the way, don't forget that you can trade in that old pfs:FILE for a 50% credit towards the purchase of a Little Brother.

Fm Dick Hollenbeck To MISOSYS, Inc: Your reply led me to look a bit deeper into my operating procedures - you were absolutely right - I am to blame! I've got so much stuff crammed into upper memory that when PRO-WAM loaded, there wasn't enough room for FILE to load properly.

@EXMEM revisited

EXMEM

Fm Mark Mueller To MISOSYS, Inc: I've been fiddling around with EXMEM and am incorporating it into a couple of BASIC programs I use (and wrote) at work. They use extensive string arrays read in from disk at a LRL of 32 bytes. In order to keep the overhead down I patched the EXMEM driver to work with 32-byte transfers (rather than 256) by changing the 01 00 01 byte sequence at 95H, BBH, and CAH relative in file record #2 to 01 20 00. It all seems to work fine, but being a novice assembly programmer, I wanted to check it out before I committed a 300K+ database file to this new program. Am I kidding myself here, or have I really stumbled onto something? If I'm OK, I'll write up the whole thing for TMQ, with about 10 different ways to use EXMEM from BASIC. It's really nice being able to store 25K of data inside a 18K program! Roy, you have made my Model 4 and 4P new again!

Fm MISOSYS, Inc: You can patch EXMEM to transfer less than 256 for the "block transfer"; but you cannot patch it to transfer MORE than 256. The Fall TMQ (II.ii) had an article by Ed Ketola on using EXMEM from BASIC. More are acceptable as the techniques are important. We're really striving for application-oriented articles - that's what's being requested.

Fm Mark Mueller To MISOSYS, Inc: I am working on a database that uses extended memory exclusively (no arrays for storage, just pointers. I wanted to make sure that I wasn't going down a blind alley, which I guess I'm not. As soon as I get it whipped into shape, I'll submit it for TMQ. I saw Ed's article, and while it was interesting, it was more demo-oriented than anything else. Guess I experimented along his lines all along. The program I'm working on uses a MID\$ mask to do field substitutions on the data in bank 1 without loading it all into a basic array. It may be generic enough to adapt to all sorts of things. I have it in a rough form using only 30 lines of code and the usr11 function. Anyway, thanks for the (usual) prompt answer. One other thing: Is it possible to make EXMEM sysgen-able? I drove myself nuts today trying to figure out why "\$XM shows up on a "MEMDIR" display as being in low core, but it doesn't work and won't reuse it's old slot on a reload (after being SYSGENED and rebooting.) Not a biggie, just wondering.

Fm MISOSYS, Inc: It's possible to SYSGEN it - with some DOS tinkering. I have an article which was submitted some time ago that depicted a method and some patches to enable @EXMEM's sysgen. I feel that it is better installed via a command line invocation (could be JCL). I may still consider the article; depends on its importance compared to others. Your article on the access of @EXMEM would certainly be desirable.

Questions on @EXMEM

Fm Stan Slater to MISOSYS, Inc: Just received Volume II, issue i of the *QUARTERLY*, and I have a question. Is @EXMEM a program that is available from you? I assume that your use of "@" before denotes program names.

I would like to be able to use the extra RAM memory, and spool, without using Memdisk, because the spooler is interrupted when using Superscript, or rather when read/write to disk while spooling to printer, and then the data and printer does not record data properly. If @EXMEM solves this problem, is it available and how much?

Fm MISOSYS to Stan Slater: @EXMEM was an added Operating System supervisor call (SVC) presented in *THE MISOSYS QUARTERLY* Issue I.iii; thus it is available by getting that back issue or the corresponding DISK NOTES. This was a facility whereby programmers could gain access to extended memory addressing from languages which inherently prohibited access to extended memory because of the location of the language program stack. This may sound Greek to you since I don't expect that you are a programmer. On the other hand, @EXMEM will not eliminate your problem, which I am uncertain as to its exact nature.

Superscript is fraught with problems; I would not personally use it or allow it to be used in this shop. I gather that you are unable to utilize SS with the DOS spooler. If that is a correct assumption, address that issue to Ft Worth. The DOS provides two facilities for using extra memory: the spooler and memDISK. Other programs may make direct use of extra memory, such as our PRO-WAM memory resident desk top manager and our SAID text editor. ALLWRITE lets you use the extra memory for additional editing buffers. Multiplan gives you a larger buffer area for spreadsheet use.

Lastly, our use of the "@" sign indicated nothing unusual. It is common practice to utilize the "@" sign as the first character of special labels; and the name of an SVC is something special.

The LSI Column

by Bill Schroeder

General Information

The current production level of LS-DOS 6.3 is "Level-L+" with file dates of 07/01/87. If you are using a version earlier than "L" you should send in for an update, (send your master disk and \$5). The "+" designation is a very small change that alters the "Stack-Split" during interrupt activity in the resident interrupt handler and in the SPOOLER in SYS8. This would be of little concern to most users, unless you run programs that stay resident in memory and are able to be activated from within other programs. It involves two ONE byte patches.

We have a couple of important items to mention this time, not the least of which is that LS-DOS 6.3 is now available as a "SITE LICENSED" product. This is a unprotected version of the same product that is provided as a single user product. The price of the LS-DOS 6.3 Site license is \$99.95 and is available for immediate shipment. Users that are already registered as holding one (or more) single user licenses will receive a credit of \$39.95 (full original cost of one copy). This allows a registered owner with several machines to obtain a Site license for just \$60. Note that we will only allow ONE credit to be applied to each Site License.

We have been swamped with a new kind of customer, one that we have never encountered before. When the system became unable to take an '88 date at boot (the first week of January) the "Tandy USER" hit us... like a ton of bricks. These are creatures (users) that we had heard about... but believed their existence to be mere myth. They exhibit a remarkable set of characteristics. They seem to be illiterate; they have not, do not, and will not, read any form of documentation, instructions, or other printed matter that references anything more technically advanced than a two "D" cell flashlight. Over 90% of these creature do not know that a computer has an

operating system (nor do they care to be told). They have never read the manuals that came with their machines (and don't intend to). They most frequently give you an accurate description of their machine by telling you what color it is "I have a Radio shack 'WHITE' computer". This caused some Model-12/6000/2000/1000 owners to get LS-DOS 6.3 for their machines... not Good.

These creatures are unable to install 6.3 correctly upon receipt, often destroying valuable disks they had. Our customer service line has never carried such unbelievable activity. We even had many users try to install 6.3 on the computers I mentioned above.

Well this should not be too bad, one might think, we have the "help" of the 7000 Radio Shack stores to corral these creatures and provide them with the "hand holding" that they need, right? **WRONG.** We have had RS store managers tell people that 6.3 will make their Model-4 MSDOS compatible or the LS-DOS 6.3 is the latest thing for you MODEL-1000, and will make it Model-4 compatible. One customer was so taken by the new power of his Model-4 he bought \$600 worth of MS-DOS software to use on his Model-4... now that LS-DOS 6.3 was MSDOS compatible. Our customer service department is not staffed with persons selected for their ability to teach computer literacy. We are technically astute about our product and find we have a very hard job even talking with these "users".

Without some form of common terminology what are we to do? How do you handle a person who answers the question "Well, what was on that disk before you began the update procedure?" with the answer, "A green label". Or how about "Did you format that disk?" with the answer, "Why should I have to, it was brand new". Or a common one like "Now do a directory of drive 0" eliciting the response, "I have two drives not zero drives and they are the 'TOP' and the 'BOTTOM' drives; what's a directory".

We have come to very much appreciate or "old" style regular customers. Most of you reading this fall into that group. Thank you for being willing to learn about the technology around you. The creatures I have described are a sad part of society.

BASIC Printer Driver

A customer was having a problem sending a character set to his printer using BASIC. At first I thought this should be no problem because the printer driver in LS-DOS is a straight PRINT THROUGH type, any character 0 to 255 will be sent out the port unaltered. Filters on the *PR device would most likely change the character stream, but characters are not changed by the driver itself. But the customer's program did not work. It was easy to find the problem, Microsoft's BASIC was the culprit, the LPRINT routine handled every character correctly and transparently when doing a LPRINT CHR\$(b); except one that was the ASCII 9 (TAB). The LPRINT routine in BASIC expands this character with spaces to the next TAB zone (multiples of 8).

The solutions would be to patch BASIC to turn this feature off or find another way to send the characters to the printer port.

What I did was create a small BASIC subroutine that would be a printer driver. This same routine will work in a MODEL III or IV. Here it is:

```
5530 'PRINTER DRIVER SUBROUTINE FOR TRS-80 MODEL-4/3
5550 ' Send value to print in PR% variable
5570 ' Status will return in OK% variable
5580 ' 0=ERROR - Printer not ready
5585 ' 1=NO ERROR - Character sent
5590 'Driver will wait for 5 to 10 seconds for
printer
5595 ' to become ready before erroring out.
```

Actual Driver

```
5600 FOR L=1 to 1000
5610 PRPORT% = INP(&HF8)
5620 STRIP% = PRPORT% AND &HF0
5630 IF STRIP% = &H30 THEN OUT &HF8,PR% :OK%=1
:RETURN
5640 NEXT L
5650 OK%=0 :RETURN
```

For those of you who are into real "Tight BASIC", this one line will do the same thing:

```
5000 FOR L=1TO1000:IF INP(248) AND 240=48 THEN OUT
248,PR%:OK%=1:RETURN ELSE NEXT L:OK%=0:RETURN
```

Well that does it a simple printer driver written in completely in BASIC and it even has a time out feature. This illustrates that there is not much you can not do in any language if you just figure it out. Drivers for other devices can also be done in BASIC with the one problem being speed. BASIC just is not fast enough for certain tasks and that can NOT be worked around.

MS-DOS matters...

In my last article I mentioned the new TANDY 1400LT MSDOS laptop machines that we were getting. Well I have been using one now for about two months, and so has my wife. We are both pleased with the machines, but for different reasons. Sue, my wife, was far from what could have been called a computer enthusiast; now Sue has become a serious user. It seems that the small un-intimidating style of the 1400 is acceptable to her. I got her PFS:WRITE and away she went. The fact that the machine may get the wife (girlfriend) or other previously uninterested person into computing alone justifies owning one of these handy boxes.

From the standpoint of a serious user I love it, I have gotten more use out of the machine then I thought I would. The LCD screen is of the Super-Twist design and is backlit. The display mode is a cross between MDA (mono) and CGA (color graphic) in the same vain as the first machines from COMPAC. The colors are represented by 8 shades of gray/blue and it seems to work out real nice. The keyboard is sort of "full sized" and works out well. The only fault I can find with the machine is the lack of a way to charge your extra batteries. The batteries must be in the computer to be charged. As of now, you can not even get an optional external charger from Radio Shack. All in all the 1400LT should be seriously considered by anyone wanting a machine of this "form factor". Also consider the AMSTRAD portable before deciding.

I have obtained the latest thing in spread sheets, Microsoft's EXCEL. This is without a doubt the most powerful application that I have ever worked with. Don't let that scare you though, it also has the best user interface I've seen. Most of the rest of your applications can be replaced by this one product (except for word processing). This product is going to change the way people use their MSDOS machines.

You might think these are strong words for what is basically a sophisticated spreadsheet program, but before you do, check it out. If you are willing to learn it completely you will find it to be a high level computer language. It in fact is probably the first of a new generation of applications generation languages. EXCEL is not cheap but weighing it against what you get, they are giving it away. Check it out. One last thing about EXCEL, you MUST HAVE, a 286 or 386 machine, 2 Meg or more of ram, a very fast hard drive, 5 plus meg of spare hard drive space, EGA or VGA video, a good high resolution printer (preferably 24 pin and color).

One more hardware thing I now have is a MAGNAVOX Multiscan monitor and a SONY Multiscan monitor. From the for-what-it's-worth department, the SONY is my choice for all around performance.

Now on to other things. I have installed the new MSDOS 3.3 from AST on my AST PREMIUM/286 and am very pleased with the new features and the internal enhancements. No apparent problems with AST's implementation. I really like the new *Fastopen* utility; works very well. The update was \$88 dollars and worth every cent of it. Seems strange that LS-DOS 6.3 has many more changes and enhancements then MSDOS 3.3 and costs less then half as much. Why do our customers complain about paying for the 6.3 update??

On the subject of updates, it is well known that the reason for 6.3 to come when it did was the design limit that kept the directory from handling any date after 1987. In January LSI had so many customers complaining that this update was planned obsolescence that I began to check a few things out.

I looked through all of the software LSI and I personally own and found NOT ONE product, running under any DOS that supported the year 2000. The only operating system that supports the year 2000 and beyond is UNIX and it stops in 2038. MS-DOS, the worlds most prolific operating system ever deals with a date in the format mm/dd/yy (or foreign derivatives). Try putting 00 in for the "yy" part; no go. All of the applications I could find that made any use of the date, also only deal with a two digit representation of same.

This is going to cause a great deal of problems in less than 12 years. Think about the consequences when most of the companies who wrote the products aren't even around to get an update from...

Thank you all for your continued support.

MS-DOS Information

MS-DOS Software

HQ Availability

Fm MISOSYS, Inc: Okay you MS-DOS folks, MISOSYS now has in stock HQ, a super memory-resident productivity package for PCs and compatibles. What you get is a very easy to use package containing: an Appointment book (calendar & scheduler), Calculator (with tape and 10 memories, algebraic or RPN), Disk manager (access DOS commands, easily manipulate files), Note pad (mini-editor & printer), Organizer (free-form card files), phone book (address & dialer), QuickKey (context sensitive keyboard macros). Configuration module lets you configure each module independently (for color on CGA/EGA). Export/import across modules and external applications (123, etc.). Full context sensitive HELP facility. NOT COPY PROTECTED. Needs 92K. Modules use moving bar command entry. *Infoworld* rated at 7.5 (very good all categories) and gave it the edge over Metro. *Government Computer News* says relating to desktop accessories, "it is the current leader in that category of software." *Software Digest* rated it NUMBER 1 (7.8) above Partner PC (7.1), Lotus Metro (7.1), Pop-Up Deskset Plus (6.9), PolyWindows DeskPlus (6.7), PC-Desk (6.5), Homebase (6.1), GetOrganized (6.0), SIDEKICK (5.6), and PC-DeskTeam (4.9). I'm talking about HQ, from TEK Microsystems. We got it for \$75 + \$4S&H. Forget the others, HQ is it! I'll stake my reputation on it. We'll even give our 30-day moneyback guarantee on the product price if it does not meet with your needs.

Fm Bill Evans To MISOSYS, Inc: It sounds good, Roy. I have two questions. (1) Does it have an ASCII table as does SIDEKICK? (2) Does the calculator have Binary and HEX operations. Both of these tools are very handy when programming.

Fm MISOSYS, Inc: There is an ASCII table in the context-sensitive HELP facility - it's not a separate pop-up module per se. No, the calculator does not have binary/hex - it is not a programmer's calculator, it is a business calc. Does 4

functions, %, handles Algebraic or RPN, a tape which holds up to 100 numbers, 10 memories, change-sign, and accepts parentheses in Algebraic mode.

Accounting Package

Fm MISOSYS, Inc: We are now selling the *Bedford Integrated Accounting Software for Small Business*. This package has been designed specifically for the needs of small business. It delivers on the promise of simplicity and responsiveness, without the struggles of sophisticated extras you don't really need.

Bedford comes with two manuals. The comprehensive User's Guide explains program operation in simple terms while the Accounting Manual outlines bookkeeping fundamentals in plain English.

The entire program is contained in one file. Payroll formulas for all states are built right in. With no complicated tables to maintain you have more time to spend with the business of doing business.

To simplify learning, Bedford includes tutorial and sample company data which clearly illustrate how easy it is to install your own data. Other services include nominally priced telephone support and program updates direct from Bedford.

This package was the PC Magazine's choice for accounting packages in its price range as noted in their 1987 review of accounting packages [*PC Magazine*, September 1987].

Without going into details here, the package covers the following modules: General Ledger, Payables, Receivables, Payroll, Inventory, and Jobcost. All modules are integrated, which means that entries made in one of the modules flows through the integration accounts to other pertinent modules. For instance, when you enter the data for a paycheck in the payroll module, the General Ledger accounts covering salaries, taxes, and benefits are automatically updated.

We have switched over to this package starting with our 1987 fiscal year which began in October 1987. I must say that it has certainly improved the data flow here. One important consideration to note is that most reports can be exported for downstream use in other data management programs such as spreadsheets, charting programs, etc.

Our catalog number for this product is R-86-135 with a price of \$245 + \$5 S&H (US).

Lair of the Dragon

Fm MISOSYS, Inc: Just a brief reminder that our Lair of the Dragon MegAdventure is now available for MS-DOS machines. This product was detailed in our previous TMQ. Order M-86-021 for \$29.95 + \$2 S&H (US). Specify disk size.

Which PC?

Machine recommendations

Fm Sam To MISOSYS, Inc: A friend who belongs to PC-SIG (not a CIS forum) said their magazine is getting more and more letters about problems with Tandy 1000 compatibility problems and advised I consider going "mainstream" with a different manufacturer. NOT THAT I'M IN THE MARKET ---- but, any comments? My "dream on" choice at the moment would have been the 1000TX.

Fm MISOSYS, Inc: I recommend an AST Premium/286. You can get a base machine (sans hard drive) for a reasonable price mail order and it is fast and well built. Check PC Pros; they advertise in *Infoworld*.

Tandy 1000

'Out of memory' cue

Fm Jim O'Reilly To All: A friend has encountered a problem with his new Tandy. He was entering his first program (over a considerable period of time) and in his most recent session got the 'out of memory' statement during entry. He tried to 'save' the program, but it wouldn't take, so he deleted enough lines so that the 'save' would work. His problem is that he can't load the 'saved' file now, and although he has 'saved' his entries along the way, the difference is about four hours of data entry. Whenever he tries the 'load' command, he gets an 'out of memory' statement, and nothing gets loaded into memory.

I believe that if there is any way to save the work done so far, CompuServe (and TandyNet) will have another convert. As a note, the program is not integral, since the majority of entry is data, and can be broken out into a sub-program.

Fm --jjkd-- To Jim O'Reilly: Can you give us a few more details, like which Tandy computer is involved, what language, which interpreter or compiler, how much memory is installed in the computer, and so on.

The 1000SX comes with 384K of memory, so lack of memory isn't it. The problem is likely that the BASIC interpreter's limit on program/data space has been exceeded. That limit is just under 64K. I can't imagine typing in that much stuff as data into the interpreter. How big is the file on disk?

Fm Jim O'Reilly To --jjkd--: I've learned that the file on disk is "over 60K", which is apparently the problem. The reason there's so much data is that the program is designed to do hydraulic analysis of sprinkler systems. The question remaining is whether this massive file already on disk can be accessed and somehow salvaged, without tossing off hours of data entry. Is there some trick to get the file loaded (even

incompletely) into the CPU? Also, exactly why can't the interpreter exceed 64K? I don't quite grasp that.

Fm Jeff Brenton To Jim O'Reilly: If your friend was typing in a program that someone else wrote, it's quite likely that it requires one of the BASIC compilers out there, such as QuickBASIC or Turbo BASIC. The interpreter is too lame for comment, although it does OK for small, quick'n'dirty programs.

Fm Jim O'Reilly To Jeff Brenton: My friend is learning about programming the hard way. I'd best liken it to driving a car until you hit something, and then reading the manual. Although he has consulted me several times, I am only a one-eyed man in the world of computerized binocular vision. In other words, I have only a vague idea of what you were saying in your message. I really need a 'listen, stupid...' kind of answer, because you can't assume that I know anything beyond byte and CPU. The program being input is original, and it is only his ignorance of the complexity of the problem of data input that explains my friend's failure to be intimidated. I shudder when I think of the bugs it's going to have. In fact, I think I'll get out of the 'programming as a second career' business altogether.

Fm Jeff Brenton To Jim O'Reilly: Well, the problem is two-fold, as far as the BASIC interpreter is concerned. The 8088 CPU is really an 8-bit processor with a form of memory management built in to allow it to address more than 64K. However, it can only look at memory in terms of 64K chunks, called "segments". There are 4 segment registers in the CPU that allow it to look at 4 different 64K chunks at a time; one for the "code" (which is the executing machine language program, in this case the BASIC interpreter itself), one for the "stack" (which keeps track of things like return addresses for calls, and sometimes data), one for the program's data (in this case, the BASIC "program" your friend wants to run), and an "extra" segment, that can also be used for data, if you know how.

Addressing more than 64K of data or even machine code requires manipulation of not just the address registers, but also of those segment registers. However, in the 8088, there is no indication that you have crossed the border between one 64K chunk and the next, so you have to constantly check yourself as you go along.

Now, GW-BASIC is really a poor translation of the original 8-bit BASIC for CP/M and TRSDOS, with support for graphics and sound added, since the hardware supports both. In the translation, Microsoft decided NOT to add the code necessary to check for crossing a segment border.

Your BASIC program is really data that the interpreter uses to tell it what to do. Therefore, it is kept in the "data segment" assigned to the program, which, as we have seen, is limited to 64K. The variables that you define in the program are also kept there; as you can see, that limits how much "program" you can type in.

Now, a BASIC compiler, on the other hand, converts your BASIC program into machine code, so the interpreter is not necessary. Also, the modern compilers I mentioned, Quick-

BASIC by Microsoft and Turbo BASIC by Borland, will generate the necessary code to detect segment crossings, so they allow you to build much larger programs.

Compilers also eliminate "dead stuff", like comments, from the final program. You keep the REMarks in the source file(s), so you can maintain the program, but the actual running program has none of them in it, taking up space. In the interpreter, all your remarks are still there, and the space they use is the same space you have for the running parts of the program, so you can't get as much in.

The PROBLEM with compilers is that you don't get the "instant feedback" that the interpreter gives you. I.e., you can't type a line in and run it immediately to see what the result is; you have to run it through the compiler first. Both QuickBASIC and Turbo BASIC allow you to run the program under development through the compiler without leaving the editor, however, and both are fast enough to ALMOST make up for the added step of compilation.

Now, if you REALLY want a "listen, stupid" type explanation, we can get into the bloody details of why the 8088 is a brain-dead chip, and why IBM's adoption of it, at the insistence of Microsoft, put the computer industry back nearly FIVE YEARS, and all sorts of nasty stuff like that. What I have just given you really should be common knowledge, but is rarely talked about. Usually, by the time anyone attempts a program big enough to tax the BASIC interpreter, they have been around MS-DOS long enough to have heard all this, and bought either (or both) of QB or TB long ago, because of the speed increase available through compilation.

Fm Jim O'Reilly To Jeff Brenton: Thanks for the speed and great detail of your response. I really appreciate the time you've taken to answer my questions, and I think I can advise my friend as to his next step. I've just told him about "FOR..NEXT" commands. Like I said, my friend has more chutzpah than I when it comes to attempting programs. But, he's interested, and if a simple 'GOSUB' explanation can keep him going, what the heck? I hope he'll understand what you've just explained.

T1000 Accelerators

Fm Jim Beard To --jjkd--: What do you have on Tandy 1000 A accelerator boards? Egghead sells an "Orchid" 8 Mhz 286 board with onboard cache and 287 socket for about \$350. It's no good for me unless it will take a 287 and actually achieve 4X speed increases with Word Perfect, Fortran compilation and execution, and number crunching.

Fm MISOSYS, Inc: I'm using an AST Hotshot/286 in my IBM PC. It runs at 10 Mhz and has an onboard 16K cache as well as 287 socket. It's a half card so it should fit into the T1000. Although its list price is about \$595, it is street priced at a few sources for \$339 (I got mine from Moneysworth). If you look at the speed statistics in the last TMQ, you can see the results. Flip the last entry in columns 6 and 7. The 16-second figure belongs to the PC e/w Hotshot.

Fm --jjkd-- To Jim Beard: Tandy's sale price on their 286 card of \$299 seems reasonable, and likely to have the

least chance of problems with the Tandy 1000. The mail order folks might have a further discount. <<short pause>> Ft. Worth Computers is quoting a price of \$248 for this item, currently out of stock but expected late in the week. That's 1-800-433-SAVE.

Fm Jim Beard To --jjkd--: I asked my local CC about a Tandy 286 card, and they haven't heard of one. The manager that was so good has been transferred to Pasadena; he probably was shot out the roof by the October 1 earthquake and now works for Sears in Atlanta. Does this card have a cache and a 287 socket? What clock rate does it run at?

Fm --jjkd-- To Jim Beard: It's an 80286 running at 7.2 Mhz. Wait state(s) not specified, but does have an 8K cache, and supports the (not included) 80287. Clock rate for the 80287 not specified, but is probably either 7.2 Mhz or 4.8 Mhz. \$250 isn't at all bad, especially since it is one of the only boards specified and guaranteed for operation in a Tandy 1000A. Somebody said that you need to leave your 8087 in place to use the 80287, which means you can't use it to partially finance the 80287, but I can't verify that myself.

Fm Jim Beard To --jjkd--: I would want to leave it in place anyway in case I had a compatibility problem someday. The 287 is probably about \$200, not having dropped to its true value of \$42.23 yet.

Fm --jjkd-- To Jim Beard: A 5 Mhz version is about \$200, an 8 Mhz version of the 80287 is around \$275. The scary thing is that the 10 Mhz version is around \$450.

Fm Phil Oliver To --jjkd--: Those prices are pretty high when you consider that a 16 Mhz 80387 goes for around \$500 now.

Fm --jjkd-- To Phil Oliver: That's for sure. The difference in throughput between a 10 Mhz 80287 and a 16 Mhz 80387 is astronomical compared to the nominal (around \$50) price difference. Too bad that many (cheap) 80386 machines come with 80287 sockets rather than 80387 sockets. Sigh.

Fm Phil Oliver To --jjkd--: I've installed an INBOARD 386/PC into my PC clone. It has an 80387 socket (in use). I've yet to come across anything more inexpensive than this \$800 board (sans coprocessor).

Fm --jjkd-- To Phil Oliver: I'm supposed to be getting one of those for an XT here at work tomorrow. Do you have the memory piggyback board, or are you running with the base 1 meg only? Any tips on configuring it?

Fm Phil Oliver To --jjkd--: I was told that the piggyback board wasn't quite available yet so I didn't order one. I expect I will in the future; I don't really need it at the moment. (Std configuration is 1 meg).

I was told by the company I got the board from that Intel wasn't promising compatibility with any computer except true blue IBM PCs/XTs, Tandy 1200s, and Compaqs (PC versions). I have a "no name" Taiwan Turbo XT clone, which according to Intel is entirely non-compatible. Since it can run

in 4.77 Mhz mode, though, I was willing to take the chance since the board was so reasonably priced. I have encountered two problems, both related to the non-IBM aspects of my computer, and both solved. The first was the fact that memory addressing is evidently not affected by DIP switches on the mother board, as it appears to be the case with true IBM. This resulted in a conventional memory conflict with the RAM on the 386/PC, since I had 640k installed already. (The entire address space is mapped to the 32 bit wide RAM on the 386/PC after initialization). Basically what I did was to remove all but the first 256k of RAM from the motherboard, which solved the conflict. (Evidently the Intel board plays games and maps its RAM addressing for that region only after boot up). The other problem was the turbo (8 Mhz) mode. The 386/PC locks up instantaneously in anything but 4.77 Mhz mode. Although I set the board up to power up to 4.77 Mhz mode, evidently there was enough randomness in the electronics immediately after power up to cause a problem with 8 Mhz mode being enabled for a few milliseconds (or something to that effect) before being switched to the proper mode by BIOS software. This resulted in initial lockups about 50% of the time after booting. I solved this by putting a wire from the 8255 output pin which controlled turbo mode, to ground, based on the system docs. This solved the problem and I've not had any noticeable problems since. My system feels as fast as any dedicated 386 system I've used. Norton SI is 18.7.

I expect a true blue system would be a lot easier, but you'll probably need a bigger power supply.

1000EX Monitors

Fm Bob Haynes: Can anyone tell me whether the RGB output of the 1000EX (or ANY CGA board) can drive a standard TTL monochrome monitor? I'm considering recommending this combination for a friend on a very tight budget. He bought a Franklin (Ace?) and a 40 column composite color monitor for Christmas at his kid's prodding... \$750! What a fiasco that turned out to be! He managed to return the Franklin but got stuck with the monitor (bought elsewhere, \$225).

I and another buddy have finally convinced him to go MSDOS; he loves my Samsung amber monitor, and my buddy's EX. Smart shopping can get him those pieces for about \$514, which will stretch his wallet to the limits. (The change buys a trip to Big-Mac Land to explain to the kid what he's doing!)

This is strictly an 'at home' application, for the kids' education and maybe the household budget, a few recipes, etc, etc. Daddy's new toy, you know.

Needs to make a decision pretty quick; what d'ya think, will this work? If so, I assume any CGA program (including Personal Deskmate) would run normally, but with shades of amber. Any comments, folks?

Fm --jjkd-- To Bob Haynes: No, it can't. The RGB output of the EX requires a RGB Color monitor with different scan rates and pinouts as compared to TTL monochrome monitors. The EX does have a composite video output, but you will find that 99% of all available (useful) software will not handle color 40 column mode on PCs very well at all. If

you get a composite monochrome monitor (cheaper than TTL mono), that will work in 80 column mode with better results as you describe (shades of amber or green).

Fm Mark P. Fishman To Bob Haynes: JJKD has said it all (as usual). The scan rate of a PC clone MDA (monochrome display adapter) is about 18 kHz, whereas the CGA uses 15.75 kHz (like a TV). The connector pinouts are different, too, and there is no grayscale on the MDA (or Hercules Graphics Card -- HGC -either).

If you go the composite monochrome monitor route, there is supposedly some resistor that can be lifted to remove the 3.58 Mhz color subcarrier and clean up the grayscale. The original IBM CGA composite output used what is called "artifact color", in which the subcarrier was supposed to act like the NTSC color encoding. It was never very good, but the presence of the carrier puts a tweed-like pattern in areas that are supposed to be colored (you see the tweed because the mono monitor doesn't filter out the carrier).

MS-DOS

MS-DOS and number of drives

Fm Stephen Sutherland To Hardin Brothers: I am assuming that MS-DOS is limited to drives A, B, and C. By your question, and knowing that you work with MS-DOS, I am obviously wrong. Please set me straight.

Fm Jeff Brenton To Stephen Sutherland: MS-DOS is now limited to drives A: through Z:. The original versions supported 64 logical drives, but the identifiers for those after Z: got a bit weird. Many network systems define drives out past E: (DOS's default "last drive"), often with the net server's drive being called N:.

Fm Hardin Brothers To Stephen Sutherland: MS-DOS can handle an almost unlimited number of physical and logical drives. I believe that version 2.x could handle 64 drives; 3.x is limited to 26, but that is surely sufficient? Right now I have drives A through G active on my AST: 2 floppies, 4 partitions on my hard drive, and a large RAM disk. I can also assign a logical drive number to any hard disk sub-directory.

The limiting factor is the hardware on most machines. My Zenith 150's floppy-disk controller can handle 4 drives; the hard disk controller can handle two hard drives and two such controllers can be placed in the machine (4 floppies AND 4 hard drives, maximum). The AST has, I believe, a controller which can run 2 floppies and 2 hard drives. There are (or were, before hard drives became so inexpensive), add-on boards for PC & XT clones which, along with support drivers, could add up to 4 more floppies and/or 8-inch floppy drives. The DOS has no problem with any of this, but sometimes the installed hardware is a limiting factor.

Of course, all drives under MS-DOS (2.0 and later) have directories and subdirectory trees (optional) which gives each a larger "feeling" than TRSDOS/LS-DOS drives. On the other hand, MS-DOS does NOT search through all active drives for a file, like TRSDOS does, which is both bad and good.

My general feeling is that low-level programming under MS-DOS is MUCH more clumsy than under TRSDOS/LS-DOS 6.x. The DOS user interfaces are different, but each has advantages and disadvantages.

Fm Ray Reyes To Stephen Sutherland: 26 drives, A through Z, configurable as either physical devices or logical drives. I'm using A through T on my 3000HD, with drives from G on up referencing various subdirectories on the hard disks (so I don't have to type long path names). D: is my secondary HD, E: is a 1.5meg ramdisk, F: is a 9-meg partition on the 40-Meg primary HD.

Fm --jjkd-- To Stephen Sutherland: In addition to Hardin's coverage, let me note that the use of drive letters higher than E: is controlled by the LASTDRIVE parameter within CONFIG.SYS in the latest releases of MS-DOS.

Printer redirection

Fm MISOSYS, Inc: In a recent issue of TMQ, the question was raised as to how one can go about redirecting the MS-DOS printer device to a disk file. That convenient capability is something most LDOS and LS-DOS folks have been enjoying for years. Unfortunately, it wasn't something too easily implemented under MS-DOS.

Along comes *PC Magazine* dated December 22, 1987 with a free terminate and stay resident utility called **PRN2FILE**. This little gem solves the problem. It operates by buffering the BIOS printer output function into a user-sized memory region. It then periodically checks the status of DOS to determine when it is safe to use a DOS function to write the buffer. I downloaded the PRN2FILE program from the PC-IRS bulletin board [212-696-0360]. If you need this capability, go for it.

Tandy 1200

M1200/DOS help

Fm Bob Haynes: Ok, folks, can anybody set me straight on my "new/used" 1200 system? This thing came with Tandy MSDOS 2.11.41 (w/o BASIC) on the hard drive, but no docs of any kind. It contains ROM version 2.5. I bought the service and user manual from RS National Parts, so I'm set there. I do have a couple of BASIC programs I'd like to run. So, I borrow a copy of BASIC from my buddy's 1000EX. Seems to run OK on my DOS, but the sound routines don't work, and that's a big part of the program. Hmmm. I have a full IBM PC-DOS 2.10 package sitting on the shelf, so I try that. It boots, but BASIC won't load; gives me a "division by zero" error, or something like that. Then I think, maybe Tandy didn't put any

BASIC routines into ROM, which I think PCDOS BASIC requires.

Shucks, I thought this thing was supposed to be 99.44% pure (compatible)! 1000EX MSDOS won't even boot, PCDOS is questionable, can't get a Tandy 1200 MS-DOS anymore, don't even want to THINK generic clone MS-DOS (what would I be getting?) Now what? I wouldn't mind buying DOS 3.x, but which one works? Can anybody confirm for me? Sure would appreciate any help.

Fm Hardin Brothers To Bob Haynes: First, no clone will run the Basic supplied with PC-DOS (any version), because it does, indeed, require routines in ROM. However, all clones that I am aware of will run the Basic supplied with "generic" MS-DOS.

There are a few things in Tandy 1000 Basic which are not generic: the sound chip and the video are the most obvious examples. In the older T1K's, those things are PCjr - compatible (although you couldn't use PCjr Basic because, once again, IBM put Basic in ROM). The newer T1K's have advanced capabilities that are not compatible with any other machine. The sound routines in the Basic that Tandy supplies with the T1K use, I believe, the special sound chip in the computer. Which explains why they won't work on the 1200, which is a true PC-compatible.

Get yourself any full generic MS-DOS with Basic (the 3.2 package was going for around \$40 at the local computer swap meet last weekend) and you should be in business. It's a good idea to use the Basic that is supplied with a particular DOS version if possible.

Fm --jjkd-- To Bob Haynes: Hardin's got you clued. The 1200 was as IBM compatible as you could get, boot and run everything except ROM BASIC, which is exclusive to IBM. Get Tandy's MS-DOS 3.2 as Hardin indicates.

Applications for the User

The following programs, although shown in their respective source code language, are nevertheless applications which may be directly usable by the non-programming user. All you need do is obtain the assembled/compiled program from the DISK NOTES 2.3 diskette which is associated with this issue of THE MISOSYS QUARTERLY.

FIXBANKS by Rex A. Basham

The following is applicable to folks using the H. I. Tech XLR8er board in a Model 4 environment.

I have rewritten the FIXBANKS utility to split the initialization routine out of the actual driver module (also out of low memory). The link into @ICNFG is totally resident in high memory. In addition, the actual bank switching code in the driver has been optimized for size and execution speed. Finally, I added 9 bytes of code to the beginning of the init routine to crank the HD64180 into overdrive at boot time without resorting to using either FAST or SET180.

The changes made to the original code are significant enough that there should not be any problems with Michael Carter's copyright on FIXBANKS. The program is called HIBANKS and the source code for it follows. Note that both /ASM source and /CMD files are on DISK NOTES 2.3.

Rex A. Basham

;*****
;
;       HIBANKS/CMD - Major overhaul of FIXBANKS.
;
;       Major mods:
;
; 1) Split the driver between high and low memory.
; 2) Crank the HD64180 into overdrive at boot.
; 3) Decrease execution time for bank 0 switch.
; 4) All redundant code in the initialization and
;     driver routines has been deleted or replaced
;     with something more efficient.
;
; Rewrite by PFM Software from JBSOFT. This program
; is freely donated to the Public Domain.
; Commercial use is strictly prohibited.

; Switch in bank 0 for system tasks. Since this is
; executed everytime an access is made to the system
; video and it's dealing with memory swapping, it
; has to reside in LoMem. This routine could
; probably be installed as a background task running
; off a high priority interrupt. That seemed like a
; lot of extra work to me, but if someone else wants
; to try it... Knock yourself out.
;
; Note: The EX AF,AF' and EXX instructions are used
; to save the register contents of AF & BC. Since
; this routine is executed so frequently, any
; machine cycle savings are very significant. The
; EXX instruction only uses one machine cycle and
; the EX AF,AF' only uses 2. On the other hand a
; PUSH instruction uses 5 machine cycles and a POP
; uses 3. Replacing the 4 PUSH & 4 POP instructions
; saves 20 machine cycles on every pass through
; here. However, since there is no assurance that
; some other program won't be using the prime
; registers, we have to kill the interrupts long
; enough for the switch to take place. Since EI &
; DI both use 1 machine cycle, the total savings in
; machine cycles is reduced to 16 which is still a
; substantial value.

CTL255/FLT

by Lynn R. Sherman

This filter is applicable to anyone using SuperScript on a Model 4 with our PRO-WAM Release 2 window and application manager.

Lynn R. Sherman
384 Blythedale Road
Port Deposit, MD 21904

I cut my wordprocessing teeth on SUPERSCRIPSIT. Despite the many complaints of problems and bugs that have been lavished on that piece of software, it has always managed to fulfill my wordprocessing requirements. The greatest drawback I encountered with SS was its inability to work with the PRO-WAM windows program.

PRO-WAM, as most of you probably know, is a pop-up window program that can be called from any well-mannered application program. It allows you to perform a calculation, grab some data, list a directory, you name it, and return to where you were in the original program. In fact, it can even transfer data back to the original program by its EXPORT function.

Unfortunately, SS is about as well-mannered as a Bactrian camel in rut, i.e. it bites, kicks, spits and regurgitates. For PRO-WAM, the primary problem is that SS does not use the DOS keyboard driver in a normal manner. PRO-WAM operates by hooking into the DOS keyboard driver in the manner of a filter. When a key request, such as a @KBD call, is answered by the PRO-WAM activation code, PRO-WAM activates. SS does not make standard calls to the keyboard. Instead it uses a special, undocumented call, the @CTL 255 call. This call causes the DOS to return a bit image of the keyboard matrix in eight bytes beginning at the location specified in the IY register pair. SS uses its own scheme to interpret the returned matrix. Since SS doesn't make standard keyboard calls, PRO-WAM never sees its activation code.

I was so annoyed by the inability to access PRO-WAM from SS that I determined to find a way to do it. My first approach was to develop a patch to SS that would at least allow me to activate PRO-WAM. This, by the way, was my first ever attempt to understand assembly language. In retrospect, I have no doubt that there must be a gentler way to ease into the subject. With the passage of time and the removal of numerous handfuls of hair from my head, a patch evolved. That patch worked by intercepting the SS error message routine and performing a @KBD call when an invalid keystroke combination was entered in SS. The patch worked - it allowed access to PRO-WAM. Still, there were two major drawbacks. For one thing, the patch would not necessarily work with future versions of SS. Even worse however, was the fact that PRO-WAM's EXPORT function remained useless with SS.

About the time the latest version of PRO-WAM was being developed, Roy came up with a better approach. He suggested that a filter could be written to trap the @CTL 255 call and then do a regular GET function. It might even be possible to catch EXPORTed data and load it into the keyboard matrix so that SS could "see" it. This sounded great to me. I sat back and waited for someone with filter and/or programming experience to implement it. Eventually it became apparent that the job was mine.

The first step was to see if I could write a filter to just trap the @CTL 255 call and GET into PRO-WAM. That turned out to be relatively easy. Then I started the real project - implementing EXPORT to SS.

I developed a set of requirements that the filter must meet. These included:

1. The filter must pass the PRO-WAM activation code to @KBD.
2. It must not interfere with normal @KBD calls.
3. It must not interfere with the @CTL 255 call except for the PRO-WAM activation code or when EXPORT is active.
4. It must recognize when EXPORT is active.
5. It must encode EXPORTed bytes into the keyboard matrix
6. It must fit into high memory above F000H along with PRO-WAM (and any other high memory modules you may use).
7. It must be creatable by an assembly language idiot, i.e. me.

First I had to figure out what bit in the keyboard matrix corresponded to what key. I wrote a small program to display the eight bytes of the keyboard matrix returned by the @CTL

255 call and noted the resulting values from pressing each key. I then converted this data into a table of which bit of which byte corresponded to each key. The resulting table is provided below. Now I at least knew what to load into the keyboard matrix to simulate each keypress.

IY +		0		1		2		3		4		5		6		7	

BIT																	

0		@		H		P		X		0		8		ENT		LSH	

1		A		I		Q		Y		1		9		CLR		RSH	

2		B		J		R		Z		2		:		BRK		CTL	

3		C		K		S				3		;		UPA		CAP	

4		D		L		T				4		,		DNA		F1	

5		E		M		U				5		-		LA		F2	

6		F		N		V				6		.		RA		F3	

7		G		O		W				7		/		SPA			

Before attempting to implement the filter, I wanted to make sure I was on the right track. I wrote another program that would input a key via the KBD call and encode it into eight bytes simulating the keyboard matrix. The program displayed the resulting eight bytes. When I was sure that each keystroke produced the correct matrix, I knew that I had a workable, albeit clumsy, encoding scheme.

Now, I thought, the rest will be easy. All that remained was to tie together the existing activation filter and the keyboard matrix encoding program. This, of course, turned out to be a major difficulty. After much assistance and telecommunicative handholding from Roy and others, a working filter was finally produced.

The program listing given here represents the present version of the CTL255 filter. This version includes some special character handling that allows access to some of SS's combination keystrokes through the use of certain characters in your EXPORTed data. I'll explain this in more detail later.

For now, let's discuss the program listing. Lines 100-770 contain the loader routine that stuffs the filter code into HIGH memory. Although the code is somewhat specific to this filter, filter loading is discussed in detail in both the *RS Technical Reference Manual* and *The Programmer's Guide to LDOS/TRSDOS* and I will not go into it here.

The actual filter code begins at line 860. We don't want to filter anything except @CTL 255 calls, so we check to see if register B contains 4 (true for a @CTL call) and if C contains 255 (true for a @CTL 255 call). Unless both are true, we

simply chain back to *KI and exit the filter. If both are true, we chain to *KI. This returns the keyboard matrix to the location specified in IY.

Now we check to see if the EXPORT flag is set. If EXPORT is active, we return a series of zeroed keyboard matrices to SS. This simulates time between physical key presses. Without this, EXPORT can overrun the SS keyboard buffer and characters are lost. Then we jump to the routine that inputs an EXPORTed byte and encodes it into the keyboard matrix.

If EXPORT is not active, we check to see if the CTRL key is being pressed by checking its bit in the keyboard matrix. If the CTRL key is not pressed, we return to SS. If the CTRL key was pressed, we perform a @KBD call. This allows PRO-WAM to activate if the CTRL press was part of the PRO-WAM activation code.

Now we check again for the state of the EXPORT flag, since if we had entered PRO-WAM, it might be EXPORTing on return. If EXPORT is active, we zero out the keyboard matrix to prevent an error and return to SS (the next @CTL 255 call will enter the filter with the EXPORT flag set).

If EXPORT is not active we return to SS with the keyboard matrix intact. This could result in a SS error message if we had entered PRO-WAM, but it is necessary if we are to return CTRL key combinations to SS.

The code to pick up an EXPORTed byte and encode it into the keyboard matrix begins at line 1320 labeled EXPIT. The first step is to perform a @KBD call. This should pick up the next byte to be EXPORTed. We check for an error condition and try again if an error is found. If no error is found, we jump to the matrix encoding routine.

If the no key press condition is detected, we perform a second @KBD. (The second @KBD is needed because, on occasion, a no key press condition results from the first @KBD even though EXPORT is not complete. Since we are using the no key press condition to indicate the completion of EXPORT, this would result in a premature end to the filter mediated EXPORT to SS. The inclusion of the second @KBD seems to solve this difficulty. However, an exact understanding of the problem has eluded me.) If the second @KBD returns with no error, we jump to the encoding routine. If an error occurs, we assume that EXPORT is complete and reset the EXPORT flag.

The encoding routine is prefaced by a test for unacceptable values. If the EXPORTed byte has a value below 20H (except for 0DH - the carriage return), we return to SS without loading the keyboard matrix. Otherwise, we set the EXPORT flag (this is my kludge to overcome the fact that PRO-WAM must reset the EXPORT flag prior to EXPORTing the final byte) and continue.

Next we reset the keyboard matrix by loading it with zeros. At this point I have added some code to check for special characters. These include backslash, caret, and left and right braces. When used in EXPORTed text, they behave as TAB, CTRL, and LEFT and RIGHT ARROW, respectively. Since CTRL and the ARROW keys are most useful as combination keystrokes, I wrote the code to input a second byte and load

the matrix as if both keys were pressed at once. This allows you to include things like text insertion, text searches, SS user defined keys, and more in the EXPORTed text. I'll have more to say about this at the end, along with some practical/impractical examples.

At this point we translate a few characters that are not accepted by SS into somewhat similar looking characters that are accepted. This allows you to EXPORT something like a month display from the CAL application without it turning into pure garbage (otherwise every vertical line character would be dropped).

If the EXPORTed value is less than 40H, we jump to the non-alpha encoding sequence. Otherwise we check for upper/lowercase by comparing to 61H. If the value is less than 61H, we assume uppercase and load a SHIFT key press into the keyboard matrix. Now we force the value to a lowercase value and look for a match with a-z. If the value were not less than 61H, we just bypass the SHIFT key press and the force to lowercase. The proper bit is set in the keyboard matrix for whatever letter was EXPORTed, and we return to SS.

For values less than 40H we use the non-alpha encoding sequence. First we look for unshifted number or punctuation codes, followed by carriage return and space. We check for values requiring special treatment and jump to the encoding routine for those characters. Otherwise we check for the shifted number and punctuation codes if no matches were found in the unshifted values. We load the keyboard matrix with a SHIFT key press, force the codes to lowercase values, do a validity check and jump back to the unshifted non-alpha encoding routine.

The final encoding sequence covers just a few characters that did not fit into the other encoding sequences. It starts with a validity check, and a return to SS if not valid. If valid, we check for the few remaining characters, load the matrix appropriately and return to SS.

The last few lines contain the relocation table which is used by the loader routine.

For any SUPERSCRIPSIT users who may decide to use this new version of the CTL255 filter, here are a few additional bits of information. As a last minute addition, I have added some code to enable the BREAK key from within the filter. This is necessary because SS disables the BREAK key. With BREAK disabled you can get into PRO-WAM, but you can't get out. In previous versions I had included a patch to SS that eliminated the BREAK key disabling. It just dawned on me that this could be accomplished easily from within the filter and eliminate the need to make any patches to SS.

For proper functioning of this filter and SS, you must choose a PRO-WAM activation code from one of the CTRL key combinations not used by SS. I would recommend CTRL + L as a usable combo.

Finally, let's go over the possible uses of the new special character feature. I would envision that this feature would be used primarily in conjunction with the PHRASE application. If you are not familiar with PHRASE, it is an application that

allows you to EXPORT a string of up to 78 characters back to the calling program. The data strings are stored in a simple ASCII text file that you must create, ideally with a text editor like SAID or even the TED application. See your PRO-WAM manual for details on how to create a text file for PHRASE. You can use PHRASE in the standard manner to store all sorts of boilerplating and frequently used strings of text. However, through the special character feature of CTL255/FLT you can now include the use of SS functions like text search, new page, programmed user keys, almost any function implemented through a CTRL key combination or ARROW key combination. The special codes are as follows:

\ backslash	causes SS to insert a tab
^ caret	causes SS to treat next character as if pressed in combo with CTRL key
{ left brace	causes SS to treat next character as if pressed in combo with LEFT ARROW
} right brace	causes SS to treat next character as if pressed in combo with RIGHT ARROW

Now here's a few examples of these codes used in PHRASE strings and explanations of what the results would be in SS.

sb^5LYNN R. SHERMAN±^5CHEMICAL
ENGINEER±^5Water Quality Engineering
Division±

This string produces my signature block. The "[^]" causes SS to implement programmed user key number 5 (CTRL 5). I have previously programmed that key in SS to produce five tabs. The "±" is the logical ENTER character for PHRASE so it comes out as a carriage return. I could have used five backslashes instead of programming the SS user key but I would have run out of room in the 78 characters allowed by PHRASE.

bp^n+++++THIS
PAGE INTENTIONALLY LEFT BLANK^c±^n

This string would cause SS to force a new page and then skip 29 lines, enter the message, center it, and force a new page.

$$\{k\} \sim \{\sim\} \sim \{\sim\} \sim \{\sim\} \sim \{\sim\} \sim \{\sim\} \sim \{\sim\}$$

This rather worthless string illustrates a couple points. It causes SS to move the cursor 4 spaces to the right and then seven spaces to the left. The left and right braces act as ARROW key presses, but they aren't accepted without a following character. The " ~ " is not a valid character for the CTL255 filter and thus just serves to "activate" the preceding "ARROW".

v p } v } v } v } v } v } v } v } v } v } v } v } v }
} v

This string would cause SS to move forward through 18 video pages. Again this is not extremely useful, but illustrates the idea.

I have no doubt that a more experienced programmer could have produced a more efficient and effective filter. Perhaps this may stimulate someone to do so. At any rate I learned a lot in the process of developing the filter and finally can enjoy the luxury of PRO-WAM EXPORT to SuperScriptit.

HEADLINE/DVR by Hans de Wolf

This filter is applicable to Model I and Model III LDOS users.

I have submitted a device driver HEADLIN5 for LDOS 5.x which produces a scrolling 'headline' on the VDU. You may use this driver for publication in *THE MISOSYS QUARTERLY* or public domain disks - if it is interesting enough.

I use this driver sometimes for prompts or debugging purposes - you can route the printer to the HEADLINE device. Combined with other filters it can be used to monitor what is sent to the printer without disturbing the normal display (which a simple LINK *PR *DO would do).

A parameter (DELAY=nnnnn) can be used to slow down the driver.

The Programmer's Corner

Bits and Pieces on C by Ken Peck

This information is applicable to anyone interested in the C programming language

BIT FIELDS

This is an article on bit fields that was inspired by the discussion in TMQ II.i. I should have sent it earlier, but I wanted to verify some things, which is what TESTn/xxx files are all about. Both programs are trivial. Someone who hasn't figured out "enum" and bit fields might find TEST1/CCC of some help. The important files are the TESTn/ASM files which are MC output and illustrate clearly (1) why bit fields should be avoided and (2) why expressions such as `-1` or `CONSTANT_1 | CONSTANT_2` should be avoided with MC where speed and memory are issues.

In the TMQ II.i, the question of initializing bit fields in C came up. Experienced C programmers rarely use bit fields. I will demonstrate what they do instead, why using bit fields is not a particularly good idea, and when it might be appropriate to use bit fields.

Suppose I am writing a program that uses 16 flags. For some perfectly good reason I don't want to use 16 integers or an array of 16 integers for the purpose. First I define my flags in a header.

```
#define FLAG_0 1
#define FLAG_1 2
#define FLAG_2 4
#define FLAG_3 8
. . .
#define FLAG_15 0x8000
```

Of course, I would use more meaningful names in a real program.

Now the actual flag storage is declared as

```
unsigned flags;
```

The flags can be initialized simply by

```
unsigned flags = 0;
unsigned flags = 0xffff;
unsigned flags = FLAG_1 | FLAG_5;
```

I can set a flag with a simple OR statement.

```
flags |= FLAG_n; /* set a flag bit */
```

I can toggle it with XOR.

```
flags ^= FLAG_n; /*toggle a flag bit */
```

I can reset set it by ANDing the complement.

```
flags &= ~FLAG_n; /*reset a flag bit */
```

I can test it with AND.

```
/* is flag FALSE? */
if ( ( flags & FLAG_n ) == 0 )

/* is flag TRUE? */
if ( ( flags & FLAG_n ) != 0 )
```

The flags can also be initialized by simple assignment statements.

```
flags = 0;
flags = 0xffff;
```

But

```
flags = FLAG_1 | FLAG_5;
```

isn't a real good idea. The compiler may generate code to load FLAG_1 into a register, push it on the stack, load FLAG_5 into a register and then call @OR. (In fact, that is exactly what MC does!) It's better if you figure out the bit pattern and use it (possibly defined) as a constant rather than indicating an operation to be performed. The same can be said for the "flags &= ~FLAG_n" expression.

All of these operations are extremely efficient and generate very compact, fast code. Bit fields look like they are suited to flag operations but they do quite a bit more and, consequently, tend to generate bulky, slow code. If you go back and read K & R carefully, you will notice that a bit field can be more than one bit wide. With bit fields and the enum extension, we can come up with something in a personnel structure like this.

```
enum ACTIVE { INACTIVE, ACTIVE };
enum SEX { MALE=1, FEMALE };
enum ETHNIC { ASIAN=1, BLACK, HISPANIC,
              INDIAN, WHITE };
enum TYPE { PIECE=1, WAGE, SALARY };
struct EMPLOY_STATUSTg
{
    active      :1;
    sex         :2;
    ethnic      :3;
    type        :2;
};
```

Now we have something like a flag (active, inactive), sex field with 2 bits, an ethnic field with 3 bits, and a type field with 2 bits (8 bits in all).

The allowed values for the active field are 0 and 1; sex 0, 1, and 2; ethnic 0, 1, 2, 3, 4, and 5; and type 0, 1, 2, 3. Determining the value of any given field can not be done simply by ANDing; assignment can not be a simple OR. Toggling is impossible.

In order to assign to a field the compiler must first generate code to ZERO out the field. The compiler must also generate code to SHIFT the value to the appropriate bit position in the structure. This involves initializing a loop and shifting the value a bit at a time (in our example, six times for type). Only then can assignment by OR be performed.

In order to ascertain the value of the field the compiler must generate code to ZERO out everything except the field and then code to SHIFT it so that its least significant bit becomes bit 0. This is true whether the field is one bit wide or 16, whether it occupies position 0 or position 16 or whatever.

When should bit fields be used? If you are storing a lot of information in a limited amount of external storage space and you really need to pack the data tightly, bit fields in the data record make sense. In the processing phases of the program, flags and enumerated data (as in the employee example) would be handled as integers. Just before the data was written to the file it would be packed into bit fields. Then just after the data was read it would be unpacked into the processing integers.

What I just said relates to another discussion in TMQ II.i. C data should be stored as integers, longs or doubles unless it is a STRING in which case it should be stored as char. In other words store strings in character storage, and characters in integer storage. Storing stuff in a character or reals in float tends to slow things down and generate extra code in C. I know that goes against the grain for those of us who did assembly language in the dark ages with machines with only a few hundred bytes of memory. I too, have a guilty conscience when it comes to storing a flag in a sixteen bit integer knowing full well only one bit is ever going to be used. But folks, memory is cheap; time is not. I just bought 64K of 150 nanosecond RAM for \$25 . . . and my technician friend tells me I was robbed. At any rate, if I spend an hour trying to save a few bytes of storage, I'm loosing money.

```
/* test1.ccc */
#include <stdio.h>

#define A_FLAG 1
#define B_FLAG 2

void status();
void action();

main()
{
    int i;
    unsigned flags = A_FLAG | B_FLAG;

    flags = A_FLAG | B_FLAG;
    status( flags );

    action("Resetting flag");
    flags &= ~A_FLAG;
    status( flags );

    action("Setting flag");
    flags |= A_FLAG;
    status( flags );

    for ( i = 0; i < 2; i++ )
    {
        action("Toggling flag");
        flags ^= A_FLAG;
        status( flags );
    }

    void status( flags )
    unsigned flags;
    {
        printf( "A_FLAG is %s.\n", ( flags & A_FLAG ) ?
        "set" : "reset" );
    }

    void action( msg )
    char *msg;
    {
        printf( "%s\n", msg );
    }

/* test2.ccc */
#include <stdio.h>

enum STATUS { INACTIVE, ACTIVE };
enum SEX { MALE=1, FEMALE };
enum ETHNIC { ASIAN=1, BLACK, HISPANIC, INDIAN,
              WHITE };
enum PAY_TYPE { PIECE=1, WAGE, SALARY };

char *UNKNOWN = "not known";
char *status[] = { "inactive", "active" };
char *sex[] = { UNKNOWN, "male", "female" };
```

```

char *ethnic[] = { UNKNOWN, "asian", "black",
                  "hispanic", "indian", "white"};
char *pay_type[] = { UNKNOWN, "piece", "wage",
                    "salaried" };

main()
{
    struct EMPLOYEE_STATStg
    {
        unsigned active      : 1;
        unsigned sex         : 2;
        unsigned ethnic       : 3;
        unsigned pay_type     : 2;
    } employee_status;

    employee_status.active = ACTIVE;
    employee_status.sex = MALE;
    employee_status.ethnic = WHITE;
    employee_status.pay_type = SALARY;

    printf( "Employee is %s.\n",
            status[employee_status.active] );
    printf( "Employee is %s.\n",
            sex[employee_status.sex] );
    printf( "Employee is %s.\n",
            ethnic[employee_status.ethnic] );
    printf( "Employee is %s worker.\n",
            pay_type[employee_status.pay_type] );
}

```

String compare functions

STRICMP/CCC and STRNICMP/CCC are patterned after those functions in the MSC library. They work like strcmp() and strncmp() except that case is ignored. I've been writing a BBS in C for the Model 4 and I needed those functions to check out user names and passwords. Again, nothing elegant, but they work exactly like MSC. You or Rick could probably make them smaller/faster. Maybe someone out there might want to stick them in their library too.

```

/* int stricmp( str1, str2 )
 * char *str1, *str2;
 *
 * Compares two strings disregarding
 * upper and lower case
 *
 * Returns 0 if str1 == str2
 * Returns -1 if str1 is lexically before str2
 * or if str1 is a null string.
 * Returns 1 if str1 is lexically after str2
 * or if str2 is a null string.
 * Returns 0 if passed two NULL pointers.
 * Returns -1 if str1 is a NULL pointer
 * and str2 is not.
 * Returns 1 if str2 is a NULL pointer
 * and str1 is not.
 *
 * Note that alphabetic characters are considered
 * "lexically after" the special characters
 * '[', '\', ']', '^', '_', and '`', but
 * before '{', '|', '}', '~', and '±'.
 *
 * Note that the behavior of this function is
 * identical to the same function
 * in the MSC v 4 library.
 */

int stricmp( str1, str2 )
char *str1, *str2;
{
    int retcod;
    /* weed out null pointers */
    if ( str1 && str2 )

```

```

        while ( ! ( retcod = tolower( *str1 ) -
                    tolower( *str2 ) ) )
            if ( *str1++ ) /* if we are not
at the end of the strings */
                str2++; /* bump pointers
for next round
                    else
                        break;
                    else /* process case
of one or more NULL pointers */
                        retcod = str1 - str2; /* force -1, 0 ,
1 on return */
        return ( retcod ? retcod / abs( retcod ) :
retcod );
    }

/* Example program illustrating strnicmp */
#include <stdio.h>
#include <ctype.h>
#include <string.h>
#include <stdlib.h>

char *s0 = "This is a string.";
char *s1 = "This is also a string.";
char *s2 = "THIS IS ANOTHER STRING.";
char *format = "%-*.s %-*.s %d\n";

```

```

main()
{
    int i;

    for ( i = 8; i < 12; i++ )
    {
        printf( format, i, i, s0, i, i, s1,
strnicmp( s0, s1, i ) );
        printf( format, i, i, s1, i, i, s2,
strnicmp( s1, s2, i ) );
    }

/*
 * int strnicmp( *str1, *str2, n )
 * char *str1, *str2;
 * int n;
 *
 * Compares at most n characters of two strings
 * disregarding case.
 *
 * Returns 0 if first n characters of str1 == str2.
 * Returns -1 if first n characters of str1 < str2.
 * Returns 1 if first n characters of str1 > str2.
 *
 * Returns 0 if n == 0 or both str1 and str2 are
 * NULL pointers.
 * Returns -1 if str1 is a NULL pointer.
 * Returns 1 if str2 is a NULL pointer.
 */

int strnicmp( str1, str2, n )
char *str1, *str2;
int n;
{
    int retcod = 0;

    if ( n )
        if ( str1 && str2 )
            while ( n-- && ! ( retcod = tolower(
*str1 ) - tolower( *str2 ) ) )
                if ( *str1++ )
                    str2++;
                else
                    break;
            else
                retcod = str1 - str2;
        return ( retcod ? retcod / abs( retcod ) :
retcod );
    }

```

Date conversion functions

DATE/H and DATECV/CCC are a couple of date functions I wrote a long time ago for our database. We maintain hundreds of records on students, each with over 2 dozen dates which must be manipulated in various ways. Mdytocd() creates a "computational date" from month, day and year integers, which can be stored in a word, compared, used to compute days between dates, etc. dtomdy() reverses the process and also (while it is at it) returns day of week, day of year, and pointers to day and month name strings. They communicate via a structure defined in DATE/H along with NO_DATE and HI_DATE definitions. As written the functions have a useful range from 1921 to 2099, which is adequate for all of our employees and students unto my great grandchildren.

```
/* date.h - header for date library header routines
*/
/* by Kenneth Peck - last modification 29-Mar-1986
*/
#define BAD_DATE 0
#define BIG_DATE 0xFF63
struct date {
    unsigned day;
    unsigned month;
    unsigned year;
    unsigned day_of_week;
    unsigned day_number;
    char *day_name;
    char *month_name;
};

/* datecv - date conversion library routines
* by Kenneth Peck */
/* last modification 29 Mar 1986 */
/*
* unsigned mdytocd( date_struct )
* unsigned date *date_struct;
* converts month, day, and year of date
* structure to an unsigned integer
* zero is returned if parameters are invalid
*
* cdtomdy( comp_date , date_struct )
* unsigned comp_date;
* struct date *date_struct;
* converts comp_date obtained from mdytocd()
* to a structure defined in the library header
* file. The structure contains the day, month,
* year, day of week, and day number in year as
* unsigned integers and pointers to day and
* month name strings
* WARNING: There is no checking for invalid
* computational dates (i.e., 0 and 0xFF64 to
* 0xFFFF. If passed these values,
* the function will return garbage.
*/
#include "stdio.h"
#include "math.h"
#include "date.h"
/*
* BASE_YEAR must be > 1900 and < 1922 and the year
* following 1900 or a leap
* year IMPORTANT !!! - Whenever BASE_YEAR is
* changed computation of the day
* must be changed accordingly.
*/
#define BASE_YEAR 1921
/*
* WARNING !!! - The constant 178 must NOT be
* changed! Computational dates for a 178 year
* period range from 0x0001 to 0xFF63, which is

4P Boot ROM Disassembled

by Adam Rubin

This article concerns itself with the contents of the Model 4P boot ROM. In essence, a complete set of comments to be merged with a disassembly of your

ROM is provided. However, due to the length of these comments, we will print herein only an excerpt of the comments, and an introduction of the methods employed so as to provide you with the flavor of the techniques used and the results you can achieve on your machine. The entire set of files associated with the article is included on DISK NOTES 2.3.

Adam Rubin
14 Michael Drive
Wappingers Falls, NY 12590

If you use a TRS-80 Model 4P, or even if you don't, you've probably heard about its mysterious boot ROM. While the Models III, 4, and 4D have 14K of ROM to hold cassette BASIC, its operating system, and a short routine to boot from a floppy disk, the 4P's boot ROM is only 4K. However, the 4P doesn't have BASIC in ROM, so there's room for routines to allow the 4P to boot from several devices, and a short memory test as well.

The time-honored method for finding out exactly what's going on has been to disassemble the program in question, and that's exactly what's been done here. Of course, the 4P boot ROM itself is copyrighted by Tandy Corporation, so we're not able to include the actual code from the ROM. However, with the GETROM program (included here), your own 4P, and a disassembler (such as DSMBLR or PRO-DUCE), that's a fairly straightforward matter for you. The challenge of a disassembly is figuring out what's going on at every point, and the function of each line of code. That's the part we've already done for you, by providing the line-by-line comments for the disassembled code.

Unfortunately, there's only enough room in this magazine for a few of the more interesting sections of the disassembly. You'll find the comments for the entire disassembly, and some related items, in this issue's corresponding DISK NOTES.

Boot Methods Available

When the 4P is booted, various keys can be pressed to force a particular boot method: from the hard disk, the floppy disk, a Model III boot (loading the ROM image if necessary), or from the RS-232 port. If no keys are pressed, it first tries to boot from the ARCNET board, then from the hard disk, floppy disk, and Model III boot, in that order. (Although the 4P is able to boot directly from the hard disk, I gather Radio Shack never asked Logical Systems, Inc., author of the Radio Shack hard disk drivers, to include this capability.)

The RS-232 boot feature is presumably for Radio Shack's Network III system, which connects up to 16 non-disk student stations (in Model III mode) to the host (teacher's) system over the RS-232 port. The ARCNET boot feature, for Datapoint's local area network, is even more obscure, as

neither the ARCNET board nor the special boot ROM was ever available for the 4P.

The official documentation for the Model 4P boot ROM is in the 4P Service Manual, and its "Theory of Operation" section is reprinted in the "Model 4/4P Technical Reference Manual". If you have either of those books, you'll probably find it helpful to read that section before studying the disassembly.

Hardware Configuration

When the Model 4P is first powered up, or when the reset switch is pressed, the 4P is set to the Model III memory map and video display, the boot ROM is switched in, and execution starts at address 0000H in the boot ROM.

The DOS's BOOT command, however, requires some of this work to be done by the DOS itself. DOS 6.x must first set the hardware to the Model III configuration, and then both 5.x and 6.x jump to location 0000H. In the Model III ROM image for the 4P, and in TRSDOS 6.1.1 and later, the instructions through address 0004H switch in the boot ROM, and when the Z80 gets around to reading the instruction from address 0005H, the boot ROM has been switched into place. For this reason, the boot ROM was intentionally written to have no code of importance until 0005H.

If the hardware is in memory mode 0 or 1, an output to port 9CH switches the boot ROM into (if bit 0 is set) or out of (bit 0 reset) the address space from 0000H to 0FFFH. Note that if the hardware is in mode 1 with the boot ROM in, any accesses to memory from 0000H to 0FFFH are read from the boot ROM, but written into RAM. This allows the 4P to execute the program in the ROM while it loads the Model III ROM image file into RAM at the same address space.

Incidentally, the special characters available in the 4P (and used in the error messages) are not necessarily the same ones available in a Model 4, as two different character generator ROMs have been used. The first, I believe, is found in early Model 4s, and the special characters 0 to 31 of that set are shown in older DOS manuals and both Technical Reference Manuals. The newer characters are in newer Model 4s and all 4Ps, and are shown in the manual for TRSDOS 6.2.0.

The Boot ROM

To determine whether the Model III ROM image needs to be loaded, the boot ROM looks for a call to page zero (CALL 00xxH) in the disk's boot sector. Nearly all Model III disks use one or more of the ROM routines there, and that tells the 4P it's a Model III disk. If the boot sector happens to be 512 bytes in length, the boot ROM assumes it's a Model III disk, regardless of the contents of the boot sector.

Since the boot ROM can't be changed as easily as, say, the operating system, it's important that it work correctly. The only evident problem occurs in the memory test. (To run this test, hold down the <> key and press the reset switch.) The value displayed for 'Mask' appears to cycle only up to 0FH, even though it actually goes up to 0FFFH before starting again at 00H.

The vast majority of 4Ps I've seen have boot ROM version 1(16), dated 18-Oct-83. The early machines, however, have version 1(15), dated 11-Oct-83. (I'm not aware of any other versions, but would be interested in hearing about them.) The only difference between these is the message displayed (and transmitted) while the RS-232 boot is receiving the file, from 'Loading ROM Image' in the older version to merely 'Loading' in the newer. I'm not familiar enough with Network III to know why this was changed; perhaps it had to do with the software for the host station. To find out which version is in your machine, hold down the <V> key while pressing the reset switch.

Excerpts from the Disassembly

As mentioned before, the comments for the disassembly of the entire Model 4P boot ROM are included in this issue's DISK NOTES, along with the screening files, the GETROM program (with source code), a utility to combine the disassembly with the comments, and a more comprehensive version of this introduction.

Since we can't include the source code for the ROM, you'll need to copy your 4P's boot ROM into a disk file, and run that through your disassembler. First, use BUILD GETROM/CMD (HEX) to type in Roy Soltoff's program (from issue I.ii) to copy the boot ROM into "regular" memory:

```
01240026F33E65EFFD7E0E08AFD3
843E01D39C210000110080010010
EDB008D384AFD39CFBC902020026
```

Next, with your 4P running under TRSDOS/LS-DOS 6.x, run GETROM, and immediately (before doing anything else that could change memory) use

```
DUMP ROM (START=X'8000', END=X'8FFF')
```

to store an image of the boot ROM as a disk file. Use PRO-CESS (or CMDFILE in Model III mode) to read in ROM/LMF, and write it out as ROM4P/LMF with a starting address of 0000H and a transfer address of 0000H. Finally, use PRO-DUCE, DSMBLR (Model III mode), or another disassembler to disassemble the appropriate sections of the ROM4P/LMF file, and all that's left is to match up the comments with your disassembly. (These three excerpts should be disassembled entirely as instructions, so you won't need a screening file for them.)

All three excerpts from the disassembly have line-by-line comments, so there's no need to describe them in detail here. In the first excerpt, 00F5H to 0150H, the 4P scans the keyboard to see what boot method, if any, was specified by the user. It then attempts to boot from this device, or jumps (at 011BH) to "no method specified." If you look closely, you'll also notice that the ROM restores up to four floppy drives when booting, and uses the undocumented <V> key for the "display the ROM version" option.

The second excerpt covers 0163H to 01BFH. It starts with the "no boot method specified" routine, which tries to boot first from the ARCNET board (displaying "Arcnet boot is not available"), then from the hard disk, floppy disk, and Model III boot, in that order. The section from 01B6H to 01BFH is used by all of the boot methods; the Model III configuration and 2 MHz clock speed are established, and control goes to a short routine in RAM (which had been copied from ROM) that switches the boot ROM out, and begins executing the boot sector that was read.

The third excerpt (01C0H to 01EAH) shows how the 4P attempts to read the boot sector from either a hard disk (entry at 01C0H) or a floppy disk (entry at 01CAH). If no problems are encountered, this leads to the routine (at 01B6H) mentioned above.

SOFTWARE TO STRETCH YOUR TRS MODEL 4

PRO-WAM™ Release 2

Window and Application Manager

Our applications turn your 128K Model 4 into a sophisticated business or personal machine rivaling the best of them. Because easily installed PRO-WAM comes with many useful and powerful menu-driven time savers and work organizers. PRO-WAM is accessed with a single keystroke; its EXPORT/IMPORT functions allow you to move data across windows between programs.

- Address CARDS, LABELS, and new HEADINGS for display and export
- Improved BRINGUP tickler file; new PRINTING and sorting
- Improved CALENDAR flags BRINGUP items visually on screen
- Ten 3 x 5 CARD files with FORMS and FIELDS using reverse video
- New virtual PHRASE access for export
- New TODO list manager with "who does it"

DiskDISK

Aerocomp HD Drivers

Fm John Tollini: For those of you that object to long messages I apologize but I feel the following must be said.

After some phone discussions I thought it would be appropriate to leave a message outlining my recent experiences with Aerocomp/Montezuma Micro. I ordered a 5m HD from them the first week of September. After a month or so of having the unit on backorder I received it. To date I have had no problems at all with the hardware, however the software is another story. When I tried to use diskDISK with the drive I discovered that the same type problem that existed in their 20 meg drivers also was in the 5 meg. I called MM at that point and was instructed to send the drivers and a description of the problem back. I sent them back and after about three weeks received replacement drivers. The only problem was that the replacement drivers were worse than the original. The original drivers at least worked properly if configured one head per logical drive. At this point I called MM again and got to listen to a tirade from John Long saying that they were really not interested in fixing the drivers because they worked fine as long as you didn't use diskDISK and that Roy should "fix" diskDISK to work with their driver. If I wanted to I could send the driver back again and see what happens but they really were not interested in fixing it. Maybe someday we can convince Roy to write drivers that work right, although I can understand Roy's hesitation to put out software that he can't test. (I actually wonder if MM tested the replacement driver they sent!) If I've learned anything from all this it would be an appreciation of the support supplied by Roy and also LSI.

Fm Ron Ungashick To John Tollini: John, I can sympathize with you. I had the same problem with their 20 Meg driver. Or at least a related problem. I never tried setting up a drive using two partitions. It took them three tries to get

the 20 Meg versions working. It is working now fine for both LDOS and TRSDOS. John Long did at least try to assist me. I don't think that he understands that the problem is on his end. Jesse Bob Overholt, who is their programmer for the drivers, at least knew it was MM problem although he blamed it (incorrectly in my opinion) on the structure (?) of LDOS/TRSDOS. Perhaps if you send a letter to MM with an ATTN: to him, he will look at it. I would hope they would correct any known software bugs. If not, I will certainly not recommend them to anyone. I have had no problems with the drive itself. If I can be of any assistance, let me know.

Fm Carl Berger To MISOSYS, Inc: Here is the screen print you requested to determine if "diskDISK" can be made to work on the Aerocomp 40 Meg with Shugart Controller. The drive is configured with 5 partitions. I formatted the drive with TRSDOS 6.2.1 and then upgraded it to LS-DOS 6.3. I then disabled logical drive 4 and switched to LDOS 5.3 and formatted drive 4 and made it the Model III system disk and disabled the hard drive disk 0.

I swapped the drives around so that when in either mode - Model 4 or Model III, the floppy drives are 5 and 6 (to avoid confusion). I'm flexible and can make the floppies 6 and 7 or whatever I have to do to get more file names on the HD!

I am also enclosing free space maps to help you see how this drive is configured. By the way, let me know as soon as you have an answer, as I am sending this drive back to Aerocomp because it has two bad cylinders, and if I can't get diskDISK for it, I may tell them to keep it!

```
0470 => C3 F4 0F 0C 91 08 7A 3F FF 3D
Drive :0 ... Free Space = 5192.00K/ 7872.00K
:0 [LDOS63 ] 5" Rigid #1, Cyls=123, Fixed
```

Fm MISOSYS, Inc To Carl Berger: Concerning your Aerocomp 40Meg drive and its applicability for diskDISK. I am sorry to report that the data which you supplied showing the Drive Control Table (DCT) for the partitions is in error; thus, diskDISK will not work for that drive. Specifically, the DCT shows (for a partition) 2 heads, 32 sectors per track (SPT), 8 granules per cylinder (GPC), and 32 sectors per granule (SPG). This calculates out to:

8 GPC * 32 SPG = 256 Sectors Per Cylinder
2 heads * 32 SPT = 64 Sectors Per Cylinder

DiskDISK uses the second method to calculate the number of sectors per cylinder. This doesn't agree with the first method.

Chalk up another failure for Aerocomp. With their persistent failure to properly write a hard disk driver, we may have to consider re-writing diskDISK so that we can support our customers who realize the value of diskDISK in their hard drive environments. If we do make that decision, it will be announced in a *THE MISOSYS QUARTERLY* issue.

Help with Aerocomp drives

Fm MISOSYS, Inc: Here's some hope to those folks who want to use our diskDISK package but they already own one

of the Aerocomp hard disk drives which do not properly set up the Drive Control Table. Because Aerocomp is adamantly disregarding the documented structure of the DCT, as evidenced by their new 40 Meg driver which has appeared well after the point has been placed on record, I have developed a patch to diskDISK which alters its method of calculating the number of sectors per logical cylinder. The patch to DD/CMD of LS-diskDISK (Model 4 version) is DD6AERO/FIX in *The Patch Corner*. The patch for Model III diskDISK is identical except for the patch location; use "D06,82=" and "F06,82=" for that release. I would appreciate those who may already have diskDISK and an Aerocomp drive to install this patch and report their findings to MISOSYS.

Fm Ron Ungashick To MISOSYS, Inc: I applied your fixes to diskDISK for the Mods 4 and III. Both versions worked correctly. I am running a Model 4 with a 20 Meg Aerocomp drive using LS-DOS 6.3 and LDOS 5.3. My drivers from Montezuma Micro "DID" work correctly before the fix. (It took MM three attempts before they got it working correctly and it appears that I have one of the few working copies in existence.) If I find any problems with your fix, I will let you know. Thank you for fixing a problem which was not your responsibility to fix.

Fm MISOSYS, Inc: Well if you are using the drivers which already worked, then that is not so much the "acid" test. If you have their old drivers which didn't work, then try them out again. I don't think their old drivers allocated their drive differently; they just didn't set up the DCT correctly.

diskDISK configurations

Fm Theodore Masterton: Ok now I understand why I want this program. One question; can you configure your drives so that one logical drive is, let's say, head two, and another logical drive is a diskdisk file on that very logical drive? Or must you lose the drive that the diskdisk "drives" are on?

Fm Gary Phillips To Theodore Masterton: You can assign a logical drive partition to one logical drive, and another logical drive can be a diskDISK file which is contained in the first logical drive. In fact, you have to keep the hard disk partition containing the diskDISK files accessible through a logical drive number that is separate from the one the actual diskDISK is "mounted" on. (Otherwise, how could you access the diskDISK file...or rather, how could the driver access it, since access is transparent to the user) This may sound confusing, but it works beautifully. I use a two-head partition to keep diskDISK files on. This partition is assigned to logical drive :7 in my SYSGEN. I can mount as many as three diskDISK pseudo-floppies at once on drives :2, :3, and :4. (:0 is a RAMDISK, :1 is the hard disk system partition, and :5 and :6 are the floppy drives on the 4P).

Fm --jjkd-- To Theodore Masterton: That works fine, and indeed is the primary diskDISK operating mode. Smatter'fact, you must keep the diskDISK "host" physical drive in the system as having an active DCT.

diskDISK and DATECONV

Fm Jeff Schock: Can anyone tell me the proper way to use DATECONV with DISKDISK. If I use it right after I create the DISKDISK then it seems to be OK, but if I copy files to the new disk I sometimes get an error that says I must use a LDOS 5.3 or 6.0 system disk. This seems to happen if I format the new DISKDISK to more than 40 cylinders. Also could you give me the message again about how to convert LDOS 5.3 files back to TRSDOS 1.3. I'm sorry I thought I saved it and when I went to try it, it was gone. Thanks for all your help.

Fm MISOSYS, Inc: If you use the patches to diskDISK which appeared in *THE MISOSYS QUARTERLY* Issue II.i, your newly DDFORM'd disks won't have to be DATECONV'd. If you are dealing with old /DSKs, then DATECONV as long as the /DSK is not a pre-5.3 system disk (can't have SYS1/SYS on it). The patches are also in a fix file (probably FIX21/TXT) in DL2, I think. To get files back to TRSDOS 1.3, FORMAT a 35T-SDEN disk to use for the intermediate. Copy files to that, then boot up 1.3 and use CONVERT.

Fm --jjkd-- To Jeff Schock: (1) DATECONV should be used immediately after DDFORM and DD. Otherwise, the unusual gran structure of cylinder zero can fool DATECONV into thinking that this is a system disk. If so, you can override DATECONV by using

```
DATECONV :n (CS)
```

The CS parameter is valid only under LS-DOS 6.3. (2) To move files back to TRSDOS 1.3, format a diskette as thirty-five track, single density, single sided under LDOS/LS-DOS/TRSDOS 6. Then, copy files to this disk. Reboot under TRSDOS 1.3, and use the TRSDOS 1.3 CONVERT utility to read this as if it were a Model 1 TRSDOS 2.3 disk.

DSM4

Eliminating SORT from DSM4

Fm Charles Ainsworth: I am using DSM4 for searching through rather extensive files for certain strings. The way I search involves the use of the DSM4 "?" wildcard character, so a search might be for something like "A???FE??T*". Now, DSM4, once all parameters have been entered, goes through its routines and then calls DSORT and both selects the matching strings and sorts them. But, I don't need the strings to be sorted, and in fact the sorting time, relatively short as it is, does add substantially to the total processing time. I only want the strings that agree with my search string, so in the aggregate, considerable time is wasted waiting for something I don't actually need.

Obviously, I don't expect anyone to custom-write software for me, but it would be a great help, if it's no trouble to you, to have some sort of patch that would arrange matters so DSM4 and DSORT skip the actual sort and only give me the strings

that comply with my search parameters, in whatever order such strings may be.

Fm MISOSYS, Inc: Try this patch to DSM4/CMD:

```
D1E,65=4E
F1E,65=44
D20,33=4E 3E 6F 20 73 6F 72 74
F20,33=44 3E 65 73 65 6E 64
```

Thereafter, the "sort <A>scending or <D>escending?" message prompt will be "<A>scending or <N>osort". An "N" response will suppress the sorting after selection. Actually, it's kind of funny. LSI coded the DSORT routine to check on "A", "D", or "N" for ascending, descending, or no sorting. But the DSM4 module only allows you to enter the "A" or "D". Obviously a more involved patch to DSM4 could be worked up to support all three entries; but my quick solution was just that - quick.

DSMBLR

Paging with DWP-510

Fm Arthur B. Davenport To MISOSYS, Inc: Concerning PRO-DUCE and PRO-CREATE, I ran into a problem with output to the Tandy DWP-510 printer. After printing the first page, and subsequent pages, the paper feeds 17 inches - that is, there is 17 inches of blank paper between pages!!! The problem is present with both programs.

Another problem with the assembler, it prints the first page too near the top of the paper and leaves too much at the bottom; after that it is not in sync with the paper fold. Maybe when the basic problem is cured, that will be also.

The printer has no "form feed" control code. I tried FORMS with Lines = 56, and FFHARD=OFF, but it made no difference. I am running the programs in a Tandy Model 4D with 128K RAM, using TRSDOS 6.2. I have LS-DOS 6.3, but did not try the programs with it; that should make no difference.

In case this problem cannot be resolved to my satisfaction, I will have to return the programs. In view of the 30 days from invoice date, I wonder if the matter can be resolved in the reSPmaining time. What do you recommend?

Fm MISOSYS, Inc To Arthur B. Davenport: Your use of the FORMS filter is the primary reason you are having difficulty with the pagination of these programs. Page 12 of the DSMBLR manual advises you to start your paper at line 5 since it prints 56 lines then a form feed. Since you have to install the forms filter to get a soft form feed, you have to make sure that the forms filter will not be generating a form feed as well. Setting FORMS to 56 lines will do that causing you to skip lots of paper for every printed page. Use **lines=66** which is the default. You also have to ensure that the internal line counter of the FORMS filter is zeroed at the

start of a printout so that it is in synchronization with any program (such as PRODUCE) which maintains its own counter. The assembler also sends a form feed to perform its pagination.

If these answers do not satisfy you, please return the merchandise per our 30-day terms.

Fm Arthur B. Davenport To MISOSYS, Inc: Your answer explained the use of the FORMS filter, and did not address the BASIC problem. Both PRO-CREATE and PRO-DUCE, when outputting to the Tandy DWP-510 printer, send a hard form feed, I guess. Anyway, each program spills 17" of paper between pages. That result is without any special filters or such; just the bare programs. I was surprised to have that result, since SCRIPSIT, LeScript, EDTASM Series I, and MISOSYS Disassembler Version II, have no problems with that to either the MX-80 or DWP-510 printers.

I tried a BASIC program to output a few LPRINTS CHR\$(13), to the DWP-510, then a CHR\$(12). I got 17" of paper. The DWP-510 Instruction Manual does not mention FORM FEED, but when it gets one, it spills 17" of paper!!

So I read up on FORMS, then put in a JCL the following:

```
SET *FF FORMS
FILTER *PR *FF
```

And it works. When that is installed, both PRO-CREATE and PRO-DUCE page OK, in the DWP-510. The FORMS defaults include "FFHARD=OFF". I changed it to "ON", and the 17" of paper was back between each page!! So, the "FFHARD=OFF" is what makes it work. The problem is solved. I, of course, will NOT return the programs

EnhComp

SIN, RANDOM, PRINT USING

Fm David Arcand: Now about EnhComp, three bugs to bring up. (1) Documentation is missing its main description of the SIN(x) command after page 4-116. It is mentioned elsewhere though. (2) Using the RANDOM command. Doesn't seem to work and causes errors on compile. RANDOM I : RANDOM 23 : RANDOM (I) : RANDOM (23). What is the proper syntax for the RANDOM command? (3) Having some problems with the PRINT USING command. PRINT USING "(###.## , ###.##)";Double, Double gets screwed up. Splitting the statement on a separate line does solve the problem though.

Fm MISOSYS, Inc To David Arcand: I took a look at your report of problems with EnhComp and could not reproduce your problems except the fact that the SIN function was not documented on a separate page but only in the appendix (not too terrible an omission). RANDOM worked fine for me. I tried RANDOM; I tried RANDOM 13; and I tried

I = 13: RANDOM I; which all worked (the semicolons are only here for separation. Example:

```
I = 13
RANDOM I
FOR I = 1 TO 10
PRINT RND(I)
NEXT
```

That compiled and ran correctly. If you have a problem, get me a specific case which fails. I also had no problem with the USING function. The following worked for me.

```
PRINT USING "(###.## , ###.##)";123.456#,999.999#
```

and produced correct results (the second number overflowed and properly printed the "%1000.00" result. So, you need to provide a complete concrete example which doesn't work.

No OUT with OUT

Fm Mike Harrow To Roy Soltoff: Hope this note doesn't turn out to be dumb letter number 1 for 1988. I'm having a problem with the OUT command in EnhComp. To put it bluntly it doesn't work. In the Z80-MODE it works great but in HIGH-MODE nothing happens.

Tagged onto the end of this note is a kludge that enables the Radio Shack Hi-RES board (Mod III) and then grays the whole screen. In LBASIC the program works fine. In the meantime the Z80-MODE does the job but I hope you can shed some light on this problem for me.

```
10 GOSUB 10000
20 OUT 131,115
30 FOR X=0 TO 79:OUT 128,X:OUT 129,0
50 FOR Y=0 TO 239:OUT 130,170:NEXT Y
60 NEXT X 70 OUT 131,252
100 END
10000 'Initialize CRTC chip for 80 by 24
10010 OUT 236,16
10020 FOR X=0 TO 15
10030 OUT 136,X
10040 READ N
10050 OUT 137,N
10060 NEXT X
10065 RETURN
10070 DATA
153,128,133,8,37,4,36,36,0,9,0,0,0,0,0,0
```

The routine at 10000 configures the 6845 chip. Line 20 turns on the Graphics display. Line 50 - OUT 130,170 - the value 170 sets alternate points. Line 70 changes to the Text display. Line 20-60 are taken from the Micro-Labs GBasic 3.0 Manual. The configure routine is from the RS BasicG Manual.

Fm MISOSYS, Inc To Mike Harrow: I investigated your "OUT" problem with EnhComp. It's definitely a bug in the SUPPORT/DAT routine which handles the high-level OUT statement. It's just coded wrong. It also is not patchable. If you can use a Z80CODE routine and a user command to perform the output until I get the chance to re-assemble the SUPPORT/DAT library. There are a few other things I need to investigate. Re-doing the library is a critical job; thus, I don't want to have to do that again real soon. Patience. As soon as we get the LDOS folks settled into their 5.3 release, I'll be

able to check into these other things with EnhComp (well OUT has been identified). Actually, I could probably come up with a patch to convert WPOKE to a workable OUT. Trouble with OUT is that there is not enough space to patch the correct code into the module.

Fm Mike Harrow To MISOSYS, Inc: I can get by with the Z80-MODE for OUT. It sounds like Murphy got into the works! This started as an innocent conversion of a QuickBASIC program. The QuickBASIC program took about 7 minutes and the same program in LDOS Basic took 1HR 20 min. EnhComp seemed like a great way to speed things up. (Anything is better than 1HR plus). Looks like my adventure turned into your Nightmare! Sorry about that Roy. Look forward to checking out the New Improved SUPPORT/DAT!! If you see Murphy kick his butt!

Fm MISOSYS, Inc: Well, wasn't actually a nightmare for me. We take things in stride. It was fairly easy to find. But the source code for the entire EnhComp package is about 4 inches thick. The problem is that the particular problem requires a re-assembly of the SUPPORT/DAT library. We have a few more little problems to check out and I want to do that just once. Since these LDOS 5.3 upgrades have us totally bogged down here, it will be a little while before I can get to it. I may just make a little mod and send you a disk with the OUT corrected in the interim.

Fm Mike Harrow To MISOSYS, Inc: A patched version of SUPPORT/DAT would be great. I don't expect it though. It's up to you. How many copies of EnhComp have you sold anyway? Does the number sold justify more time put into SUPPORT/DAT? I'm not a professional programmer but if I can help with any problems let me know.

Fm MISOSYS, Inc: We have shipped probably about 100 copies of EnhComp. It's not a question of whether the number sold justifies the time to fix a bug. Bugs must be fixed. We won't spend the time to add features. Also, I can't patch SUPPORT/DAT in this case, it needs to be re-assembled.

EnhComp Manual Deficiencies

Fm Robert B. Lockhart: Your documentation is curiously well-organized. I have never seen a document without an index that didn't need one. However you don't cover LOF, or LOC functions in the alphabetical listings of the BASIC commands. This was most irritating and required that I experiment to see what was allowed for LOF and LOC functions. It also leaves me wondering what else you left out of your manual. One other point that so many high powered expert writers forget is to use examples most liberally. I don't know of a case where anybody ever wrote too many examples to show what was being written about. Indeed one fellow wrote his documentation with problems which he solved in addition to his liberal use of examples. Now that was one documentation that I understood. Your documentation is most sadly lacking in a liberal use of examples along with your written instructions. True there are examples, but not a liberal amount of them. This is also a great irritation. Indeed some of the examples leave much to be desired. For example, you really describe in glowing terms the wonders of the OPEN "X",blknum,"filename\$",reclen statement. But

alas so poor are the examples of this glowing wonder that I still don't know what it is that you so glowingly talk about here. Now I know what this makes me. What the actual words you would use I can imagine as I have run into letters like this on your side of it. It is when I wrote a letter like ones that I received to handle that I realized that the problem extends beyond the scope of the writer's native intelligence level.

Namely it is the writing technique de-emphasizing examples and emphasizing the descriptions. Descriptions without an adequate amount of examples are miserable to decipher no matter how well written. But a document with lots of examples need not be the best written document in the world to be a joy to decipher. With examples and written text, I find it enjoyable to decipher the code of some program so that I can use it.

I am most enthused with your programs for generating /CMD stand-alone programs from BASIC programs and find your program most interesting to follow through on. I just wish the irritations were not there. I like your program however and I will keep working on the irritations and the bugs until I run out any more moves to make or I have gotten it to work as a stand-alone /CMD program. My comments are from an appreciating heart and I hope you, the reader of this letter, can believe that.

I still think that I have gotten the documentation for the Model 4 in the Model 3 mode. If I am wrong then I apologize but nothing that I read here says this documentation covers both Model 4 in the Model 3 mode and the Model 4 in the Model 4 mode. If I have gotten the Model 3 instructions and there are Model 4 instructions then I would appreciate getting the Model 4 instructions.

Fm MISOSYS, Inc To Robert B. Lockhart: To begin with, there is only one EnhComp manual and it is used for both Model III EnhComp and Model 4 PRO-EnhComp. The compiler package works identical on either machine OS environment as does every statement and function; thus there is no need to have a separate manual. There is no statement in the manual specific to this. The only clue is the statement made about distribution disks; it refers to both TRSDOS 6 (Model 4) and Model III mode as two discrete distribution disks.

Both the format and depth of the manual are due to a product which came to market too late to make any significant penetration. The author, Phil Oliver, developed a product which had many unique and useful facets (i.e. the integrated editor-compiler program development, multi-lined functions, user commands, in-line assembly code, etc). His was a Model III mode package. I felt that the user community should have an opportunity to explore these features. I also had to finish up the package, port it to the Model 4, and redo the rough-draft user manual. Because of the limited sales potential (again due to the timing of the product), some compromises had to be made. There was no justification for writing a more in-depth manual. As you already noted, some things were omitted - albeit inadvertently. LOF and LOC are in the appendix. Since they behave identically (or should) to their interpretive BASIC counterparts, that should not present you with any problems. No user manual can be considered to be the ultimate; that's

why there are tons of books on the subject of programming to be found in just about any store which sells books.

The utility for the "X" mode of file access is that it enables the direct use of logical records of greater than 256 characters. Microsoft BASIC random access files are limited to at most an LRL of 256. For some folks, that has been a constraining limit (such as the one on strings of at most 255 characters where EnhComp supports 32767). Although X-mode is a feature distinct to EnhComp, the previous paragraph provides the reason for the scope of the material documenting this feature. But an XFIELD is used quite similarly to a FIELD statement; and access of X-fielded files is the same as normal FIELDed files (via the GET and PUT commands). Certainly many examples would be more illustrative of this fact.

THE MISOSYS QUARTERLY is a good place for expanding on the uses of our products. Although I cannot guarantee that EnhComp will be covered to the extent you may desire, TMQ nevertheless serves a good many folks by containing a storehouse of information on the use of our products.

Problem with INPUT#

Fm MISOSYS, Inc: Phyllis Williams reported a problem when using EnhComp to read an input list generated from interpretive BASIC. Seems that certain numbers in the input were skipped. Here's my solution to Phyllis.

I have traced down the problem which you reported using EnhComp's INPUT# statement. The problem was prevalent when the input of variable data was from a file which used space-terminated fields rather than comma-terminated fields. The actual culprit was an incorrect algorithm in the single-byte backspace routine.

I have applied the fix to your program disk's SUPPORT/DAT file and have also included a copy of the fix for you (SDAT63/FIX). Please apply the fix to any other disk with the SUPPORT/DAT file or copy the SUPPORT/DAT file from this program disk.

Thank you for taking the time to give us an adequate description of the problem and supporting files which reproduced your results. That kind of cooperation makes it easier for us to deal with these reports.

Note that the SDAT63/FIX and SDAT54/FIX files are printed in *The Patch Corner*.

LS-FED-II

Bug with 256-sector cylinders

Fm Scott Sadow: I have found a minor bug in LSFEDII. I realize that this product is probably no longer supported (I got it in the MARK4 collection). The bug occurs when you try to access a disk, as opposed to a file. If LSFEDII's calculations end up thinking that there are 256 sectors per cylinder, the

program will crash the system when it tries to read the directory. LSFEDII checks to see if the number of sectors per cylinder for the directory is less than or equal to 34. When there are 256 sectors/cylinder, the 256 is calculated in 8 bits and results in what looks like 0 sectors/cylinder. When this number is compared to 34, it is less than 34 so it is accepted as valid. This 8-bit quantity attempts to read in 256 sectors. This results in reading in too many sectors into memory. High memory is first overwritten, and if your computer doesn't die then, low memory is written over.

After the few hours it took me to find this irritating bug, I wrote a patch for LSFEDII which fixes it. I couldn't find anywhere to put the patch because it looks like LSFEDII uses memory above and below itself, so I shortened the text of a message to squeeze the patch in. The message used to say "...Logical Systems Incorporated" and it now says "...Logical Systems Inc.". I hope that this message change doesn't cause any problems. Anyway, the patch follows. You might want to put it in a future *THE MISOSYS QUARTERLY* in the Patch Corner. (The patch is given freely for anyone who wants it.)

```
.LSFEDII/FIX
D32,71=CD FA 40
F32,71=32 1C 64
D11,06=2E 0A 0A 46 69 6C 65 73
F11,06=6F 72 70 6F 72 61 74 65
D11,0E=70 65 63 20 3A 20 0E 03
F11,0E=64 2E 0A 0A 46 69 6C 65
D11,16=B7 20 02 3E 22 32
F11,16=73 70 65 63 20 3A
D11,20=1C 64 C9
F11,20=20 0E 03
```

Fm MISOSYS, Inc: Thanks for the patch. You are right, though, LS-FED-II is a discontinued product.

FED's UPDATE command

Fm Gary W. Shanafelt: I've recently discovered a problem with the date stamping abilities of LS-FED-II, version 2.0.2, for the Model 4. Specifically, the "U" command, to update a file, doesn't seem able to work with dates after 1987. I have LS-DOS 6.3 with its new dating ability; is there a patch to enable LS-FEDII to do the same? At the moment, "1988" with LS-DOS is stamped "1980" when LS-FEDII updates a file. This item might be worthy of inclusion in the Patch Corner of the *Quarterly*, if such a patch exists...

Fm MISOSYS, Inc: LS-FEDII is a discontinued product. If anyone works up such a patch and submits it to us, we will consider it for TMQ. Scott, are you listening???

Little Brother

Moving from field to field

Fm Shane Dawalt To Roy Soltoff: I was reading TMQ (FALL issue) and found a spot about Little Brother. I just bought LB and got it installed. After I figured out how it works, it is a pretty good data base program. Not bad at all. Anyway, I read in TMQ where you might be rewriting LB in PRO-MC from ASTEC C80. Is there any room for a minor enhancement (at least what I 'think' is a minor enhancement). When entering data (as in Add Records), why not have the cursor skip automatically to the next field if the current field is full. I found this quite helpful in DBIII+. I know, LB isn't DBIII+ and I'm not trying to force LB to act like DBIII+ in any way. But I rather liked this feature since when a field got full (as in a 1 character field or a date field) the cursor would automatically skip to the next field without lifting a finger for the RETURN key. Perhaps there is a bit or two left over for a flag which can be used to allow the user to select whether the cursor automatically skips or not. Just an idea. At any rate, good job on TMQ, FALL issue and on LB!

Fm MISOSYS, Inc: If LB would automatically skip to the next field when a field was full, how would you go back and edit it? Also, a lot of folks prefer to explicitly exit the entry of a field. Automatically leaving when the last character was entered would upset folks with fumble fingers who may often have to <BACKSPACE> and correct. Yes, an option would deal with that. We will be looking at LB this year. Just how much is taken back to the M4 version is an unknown.

Fm --jjkd-- To Shane Dawalt: As I recall, this topic came in for much "spirited discussion" during the implementation of LB. I personally don't care for "autoenter on field full" as a normal or default option, because you have to do things "differently" depending on the contents for fields that don't normally fill the entire field. As I recall, there wasn't enough space/time/energy to make it configurable.

Fm Shane Dawalt To MISOSYS, Inc: Well, if you look at LB a little, you'll notice there is no direct way of moving from field to field anyway. The way I've been doing it, and the only way I have seen, is by pressing ENTER multiple times to get back to the field I desire to re-edit. Normally, the arrow keys move from field to field. I know, but they have to move the cursor too. One feature I was surprised to find (on a machine which has only 1 backarrow key) is a double delete key. F2 deletes from the current cursor position and Backspace deletes by rubbing out the characters. All programs I write with nondestructive cursor movements use F2 to delete and Backspace to move the cursor backwards (nondestructively of course).

Fm MISOSYS, Inc: Yes, at this point, only the <ENTER> key gets you to the next field. When (and if) I get into that again, I'll probably add some more flexible movement. Now as far as being "compatible" with other packages on the use of function keys, one has to put into

perspective when products were developed. LB goes back a few years.

Fm Shane Dawalt To --jjkd--: I remember I wrote a program once (gone long time ago) which used the type of line editing available in LB. There were fields on the screen and I wanted it to be able to autoenter on full fields. Well, I wanted it to do other things too, but by the time I got the editor completed I was out of the notion to use the bloody thing! (And that's why I prefer buying software over writing it.)

Anyhow, LB is a pretty nice package. I thought it clever how LB allows the user to build his/her own input and output screens.

Fm Shane Dawalt To MISOSYS, Inc: As far as function key compatibility goes, that wasn't meant to be a complaint on LB. The idea of 2 delete keys was the major reason; but even that is a minor issue altogether.

MAXDOS6 and Little Brother

Fm Anthony Sowers: When I use the SORT option on my MAX 80, the program breaks with the message "Data file open error" and after <CR> returns to MAXDOS. I've used the program in an identical manner on the Model 4P I also have no problems. I can recover by reset to the data file and the TMP file and then re-enter Little Brother. The index I have built appears to be OK and the program seems to use it OK with no damage to the data file. It is, however, a real problem to an inexperienced user (in my office) to go through all this. Does anyone know about this problem and how to prevent it?

Fm MISOSYS, Inc: While working on this issue of TMQ, I decided to check into Tony's report. The effect experienced using the LB SORT module while running under MAXDOS occurs because the MAXDOS 6 file open facility operates similar to the TRSDOS 6.2 file open facility if the NETWORK FLAG bit-0 was enabled. This flags the directory that a file is open. I confirmed this by enabling bit-0 of the DOS NFLAG and running LB on my 4P. I got the same result as Tony did: the database file and the temporary data file were left unclosed after the LBSORT module completed. The "Data file open error" message is generated from the LB main menu module when it attempts to re-open the data base file.

I then decided to fix the problem. Investigating the LBSORT module, I found that when it completed, it didn't close the database/LB file or the database/TMP file. In order to find space to add some patch code, I had to eliminate the "Disk error during read. Can't continue." error message. I then modified the "I/O error during write. Can't continue." error message to read "**** error during I/O. Can't continue." I then was able to shoehorn in some patch code to fclose(fdD) and fclose(fdT); which is the C-language code to close the database and tempy files. This patch is LBSORT1/FIX printed in *The Patch Corner*.

LB record access speed

Fm Anthony Sowers: I am using Little Brother on a MAX 80 under MAXDOS6. I have double sided 80 track drives, so I have system files, program files, and data files on one disk. I'm using the extra 64 K of memory as a ram disk and putting the system there. I still have about 15k left on the ram disk.

The problem is that the churning of the drive is driving me nuts. It is really obtrusive when I am using an index file in update mode to find various records. On each find command, the drive steps back and forth at least 9 times. This is both noisy and SLOW.

There are a couple of solutions I can think of: (1). arrange the disk so the files being used are closer together. (2). place one or more of them on ramdisk. I have not yet deleted sys5 & sys9 -- that would give me a few more k on ram disk. The problem is that I have no idea what files are being accessed so busily. I'd appreciate any guidance you can offer. If you can point me in the right direction, I think I can do the reconfiguring of the disk or ramdisk.

Fm --jjkd-- To Anthony Sowers: Putting the index files on a different physical drive as compared to the data files is probably the best and only thing you can do other than going to a hard drive.

LB Installation Manual

Fm Don Elswick: I'm using the LB Installation Manual page 2. I'm using environment #2. Then I go to page 4 and use method 2. First paragraph is no problem. The CREATION disk is made. The problem I have is the second paragraph. I get the message "//PAUSE Place INSTALLATION diskette into drive 2 and press <ENTER>". At no time do I get the message to put "LB STARTUP" into drive #2 like your procedure says. This also happens in "DO RUNTIME". Am I doing something wrong or just miss reading the procedure?

Fm MISOSYS, Inc To Don Elswick: This is in response to your letter of 11/27/87. There are three places where the LB Installation manual is in error on page 4. The CREATE/JCL and RUNTIME/JCL files are correct. The LBHELP/HLB file is on the provided disk labeled INSTALLATION. So the statements that begin, "Place the LB STARTUP disk into drive :2..." should read "Place the LB INSTALLATION disk into drive :2..."

By following the procedure displayed on your computer, you would have had no problem. You did not need to perform the COPY command manually as the help file was already copied.

TRSCROSS moves LB database

Fm MISOSYS, Inc: One of our users recently had problems moving his LB database from his TRS-80 over to his MS-DOS machine. Even though his Model 4 LB database was not password protected (within LB), LB86 would not allow him access to his data as it recognized it as being protected. The problem was that TRSCROSS thought the file was

ASCII. The internal data base password is a hashed value and is not necessarily an ASCII value. Thus after the user transferred the file again using TRSCROSS but specifying BINARY as the file type, LB86 correctly operated on his data. A word to the wise: If you are using TRSCROSS to move LB data base files from a TRS-80 to an MS-DOS machine, please correct the file type in the TRSCROSS menu to reflect the file type of BINARY.

MC

A word about MC Release 1.6

Fm MISOSYS, Inc: Apparently we wound up with a minor error. It seems that two patches listed in *THE MISOSYS QUARTERLY* Volume I, Issue ii (MC60C/FIX and MC62C/FIX) were never applied to the master PRO-MC disk. Since we generated Release 1.6 from the previous release, the new release also doesn't have those two fixes installed. We finally got that corrected. Please check your README file to determine if the patches were applied to your 1.6 PRO-MC release.

Another thing is relevant to the MCMACS/ASM file on the Model III release (MC). This file includes EQUates of the UNIX error numbers; they should be removed from your file if they are present.

The MCMACS/MAC file has two macros, \$LSTR and \$LDF, which are not used by MC. They may be deleted from your file.

MCOPT optimizer

Fm Richard Watkins: I was looking through the directory on my Pro-MC disk and came across the file MCOPT/CMD and wondered what it does. I can't find a reference to it in the manual, although one may exist. When I enter the program with no parameters it returns the message:

```
MCOPT [flags] filespec [/ASM]
```

Can any one tell me what the advantages might come from optimizing the assembly code and what flags I should use?

Fm Gary Phillips To Richard Watkins: MCOPT is described in the README file on your distribution disk. Suggest you take a look at this file, perhaps print it and insert it in your manual.

Fm Richard Watkins To Gary Phillips: I soon found that out. I read the information about MCOPT and understand how to use it but does it help with speed or size or both? And also how many passes should I make?

Fm MISOSYS, Inc: MCOPT will help with speed, not size. It also should not be bothered with until you have

completed program development, as the time it takes to run it shouldn't enter into the development time.

Fm Gary Phillips To Richard Watkins: Sorry, I'm too new to MC myself to tell you what virtues MCOPT does or does not have. I CAN tell you it takes a long time to run and is probably better skipped while you are developing code. Roy should be able to tell you what advantage there is to using it.

Fm Shane Dawalt To Richard Watkins: The few times I've used it, I let it determine the number of passes to make. I believe it defaults to 4. This is great for small programs, but for larger ones you may want to decrease this number--lest you set at the computer all day without doing a thing. I don't think it makes it significantly smaller, but it does take out some of the code which slows down the execution. I have found some significant speed increases at times. It depends what your program is to do. (By significant speed increases, I don't mean 40% faster or anything. Probably less than 20% if that. I didn't do any calculations on the data.)

Fm MISOSYS, Inc: Actually, MCOPT will perform incremental optimizations by module in an attempt to increase the speed of execution of the resulting code. The number of passes MCOPT performs is not limited to any particular number. It will continue to scan through a module until a pass achieves no changes from the subsequent pass. Perhaps one day we will discuss the kinds of changes introduced by MCOPT.

Keyboard echo

Fm Dave Krebs: I received the MC package the other day and am starting to learn. It's tough on an old guy! Now for the STUPID question - I have the following two lines

```
printf("Enter lines per page <CR>=33 :");
scanf("%2d",&lines);
```

By the way, lines is defined as "int" and I have included <stdio.h>. Now here it is. How come the answer to the "scanf" is not echoed to the CRT? By the way, I'm trying to use The C Primer + Revised edition.

Fm MISOSYS, Inc: To echo stdin, you need to set the KBECHO option. This is discussed under the docs for option().

Fm Jeff Brenton To Dave Krebs: First of all, unless you specifically ask MC (or most C compilers) to echo stdin to stdout, you will NOT get an echo of your input. Look up KBECHO in the index of the manual. If you want to echo the input, consider using getc() and putc() to get and put the string, AFTER you check for the special condition of a null string (i.e., the user just hit <CR>). In fact, to save loading the floating point library unnecessarily (which will happen with printf(), scanf(), and related functions), take the string and use atoi() instead. Why do this, when a "convenient" function like scanf() exists? Because scanf() is a very difficult to master function; too many "gotchas" waiting to catch the EXPERIENCED C programmer, let alone the novice. Things

like specifying an integer field, and the user inputs a number with a decimal point. Scanf() will stop converting at the ".", and return the integer; subsequent fields read from the input stream will then be off, and you have virtually no way of detecting it!

Fm Dave Krebs To MISOSYS, Inc: I got a reply on Tuesday from Jeff Brenton (said the same thing). I went looking for KBECHO in the index as he said and couldn't find it ... well I did last evening when I sat down and read the WHOLE manual from HEAD to TOE! I found it (O_KBECHO). Boy, I thought I read enough to get me started the first TWO times.

Fm MISOSYS, Inc: Alas, the library update will probably add another 25-30 pages.

Checking input availability

Fm Richard Watkins: Under PRO MC does 'c=getc(stdin)' suspend the program until a character is press on the keyboard. What I am trying to do is implement a screen blanking module in my input routine. I am using a while loop to filter out certain characters and within this loop I check the elapsed time since the function was called. It appears that it does suspend the execution. If so is will it suspend execution with other streams like *cl, and is there a way to get around it?

Fm MISOSYS, Inc: That function says "get the next character from the standard input (which doesn't necessarily have to be the keyboard). If you want to strobe the keyboard to see if a key is pressed, use the inkey() function which is in the installation library, IN/REL. The inkey() function is documented on page 4-100 of the manual. A good example of its use is also provided. From the kinds of questions posed on our CompuServe forum by you about our MC product, I would recommend that you take a little time out to go through the entire manual page by page so that you gain some familiarity with what MC has provided you. You really should know the functions that you are provided. Without a good understanding of the provided library, its sort of like trying to calculate without knowing the number system.

Fm Richard Watkins To MISOSYS, Inc: I knew about inkey(). The program I am working on is a bulletin board program so I will have to strobe the key board and the RS232 on an alternating basis. I open a file stream to *cl so that I can read from the modem using the getc function. Is there a way to strobe it like the inkey does the keyboard?

Fm MISOSYS, Inc: Again I must ask you to review your MC manual. Read about the checkc() function. It checks a stream for available input. That may be your solution. You should also note that THE MISOSYS QUARTERLY Issue II.i (summer 1987) had a program listing called CTERM on page 54 which used the checkc() function in a C terminal program for exactly the issue of checking if input was available. You are NOT a TMQ subscriber; I recommend that you become one. I think that if you had the proper resources available to you, your productivity would increase. We provide the information. We can't force you to read it.

Fm Shane Dawalt To Richard Watkins: I believe that you can use the checkc() function. It is used to check if a character is awaiting on a particular stream. You could use it to check both the stdin stream as well as the communications stream. In fact, the PRO-MC manual suggests this problem in the function's description.

Does dfix() needs fixing?

Fm Pete Betz To MISOSYS, Inc: I'm having trouble with a function in MC and I don't know whether I'm doing something dumb or I've stumbled upon a bug. The problem is that dfix(), dint(), and floor() quit working above a certain magnitude, which, interestingly enough, happens to be 32767. In short, it's telling me that dfix(32767.999999)=32767.000000 but dfix(32768.111111)=32768.111111, and everything larger that I've tried has the same problem. I'd appreciate it if you could tell me what's wrong.

Fm MISOSYS, Inc: I believe that dint() and dfix() will quit above the maximum value of an integer (which happens to be 32767). That's just how they are coded. Now they are not standard C functions. Floor() should not necessarily behave that way. But I'd have to check the source to say for sure.

Fm Pete Betz To MISOSYS, Inc: Thanks for the reply. I'm pretty sure floor() cuts out the same way as the others. Anyway, I'm glad to know it wasn't just me goofing up. Incidentally, I'm really enjoying working with MC and MRAS. Just got the update and am trying to familiarize myself with the new stuff. Quite an improvement over Alcor, to say the least...

Fm MISOSYS, Inc: I'm waiting to hear feedback on the new documentation. Gosh, all that work with our laser printer and I have yet to get a comment.

Fm Pete Betz To MISOSYS, Inc: Well, I certainly noticed that it is beautiful! Striking, even. But I think I have a complaint, too. I would have preferred to have each function on a separate leaf so that they could be stuffed into their proper alphabetical positions among the original docs. But I wrote the title of each into its proper position in the main documentation, so I shouldn't fail to find them when needed.

Speaking of documentation, one remark in the original documentation is really neat -- namely the remark that structs, with their members, resemble records, with their fields. As a struggling C programmer, that really helped to make me more comfortable with structures.

Fm MISOSYS, Inc: We had considered putting each function on a separate page to allow insertion into the manual in place, but the additional costs and operational expenses prohibited that. We have to duplicate these update docs on our own copier due to the extremely low volume of copies. Since the docs are 40 pages, that would have stretched out to perhaps 60 pages. Unworkable for us.

Solution to dfix()

Fm MISOSYS, Inc: The culprit in the dfix() problem referenced above was traced to the LIBA \$dint routine. As an aside, floor() is just another entry name to dfix(). Now the dfix() routine uses the low-level \$dint routine to check if the double can be converted. However, this routine was left around from the days before we included support for long integers. Thus, the \$dint routine referenced the \$d2i routine which converts a double to an integer (short integer in the case of MC's 16-bit integers). The solution is to re-code \$dint to use \$d2l and \$l2d instead of \$d2i and \$i2d. Here is the listing of the revised routine which has the module name of FDFIX in LIBA/REL.

```
;FDFIX/ASM - 02/09/88
      ENTRY      $DFIX,$DINT
      EXTRN      $FSGN,$FCS,$D2L,$L2D
      CSEG

;*****
;
;*****
;Routine DFIX
;*****
;Is number negative?
$DFIX  CALL      $FSGN
;Take dint() if => 0.0
      JP         P,$DINT
      CALL      $FCS
      CALL      $DINT
      CALL      $FCS
DFIX1  XOR        A
      RET

;*****
;
;*****
;Routine DINT
;*****
;Can we convert to integer?
$DINT  CALL      $D2L
;Use original value if can't
      JR         NZ,DFIX1
      JP         $L2D
      END
```

I assembled this module and tested it with the following program:

```
#include <stdio.h>
#include <math.h>
main()
{
    double dnum;
    for (dnum=32767.588;dnum<32769.50;dnum+=0.1)
        printf("dfix(%11.5f)=%11.5f\n",dnum,d
fix(dnum));
}
```

MRAS

MRAS Compatible with L80?

Fm Gary Phillips To MISOSYS, Inc: Is MRAS output compatible with the L80 linker? I had the impression that it was supposed to be, but ran into something suggesting it is not. In DL1 here there is a file called SVC.MAC. This file is one of Jim's examples on calling assembly language from FORTRAN. I find that if I assemble the *AL portion with PRO-MRAS and the FORTRAN with F80, then link the two with L80, the program freezes the system upon execution. However, if I use M80 to assemble the *AL module, and link

the two the same way, the results are normal and the program runs successfully. MRAS reports no error, and neither does L80, but the program will not run if assembled with MRAS.

It does make use of a COMMON, and I remembered some patches in TMQ that made reference to problems with COMMONs, so I went through TMQ and applied all the PRO-MRAS patches that have been published. It didn't help... the results are still the same. Have I misunderstood something, or have we got a bug here? Thanks for checking it out.

Fm MISOSYS, Inc To Gary Phillips: Don't know without seeing the files in question. MRAS output should be compatible with linking by L80. The converse should also be true. But you cannot use MLINK to link modules generated by MicroSoft high level language products. Send me a disk containing all the relevant files and I will be able to investigate your report. Without them, I can't.

Fm Gary Phillips To MISOSYS, Inc: OK, will send you a disk after I try the whole thing once more to make sure I did what I think I did. Can you handle double-sided LS-DOS 6.3 format? That way I can probably include all the /CMD files as well as source and some JCL to repeat my sequence of commands. Do I need a PRO-MRAS update? I could send my master and \$5 along if you think it likely, but I already have applied all the TMQ patches to PRO-MRAS and PRO-MLINK. (Note: I was aware that MLINK doesn't work with F80 output, so did not try that. L80 was used in both cases.) In case you have a minute to look, the source file in question is SYSTEM.MAC in DL1, and only takes about 30 seconds to download at 1200 baud.

Fm MISOSYS, Inc To Gary Phillips: I dug into your MRAS problem and found what the difficulty was. It turned out to be a bug in MRAS which showed up if you used exactly one named COMMON, or more than one where the last COMMON referenced was the same as the first one referenced. MRS613/FIX is a little patch to correct that. We worked up an equivalent patch, MRS513/FIX, for Model III MRAS. Both are in *The Patch Corner*.

Fm Gary Phillips To MISOSYS, Inc: Good swat, Roy! And another notch gets carved on the handle of the MISOSYS, INC. bugswatter. Applied the patch, and the problem is cured. Thanks for the quick response!

Fm MISOSYS, Inc: Well, you made it easy for me. You had a set of files which worked one way and not the other. Actually, the easy way for me to discern the problem was to use the UNREL package. I used DECODREL on both the M80 assembled REL and the MRAS assembled REL and puzzled why mine was different. It didn't take long to find the culprit. That patch added a re-initialization of a byte which keeps the number of the last COMMON block selected. It must get reset to X'FF' at each pass of the assembler; it wasn't.

DS defined space

Fm --jjkd-- To MISOSYS, Inc: I remember this being discussed here, but I don't recall the answer. What is the best

way to define a block of allocated but uninitialized storage so that it does not take up space in the /CMD file?

Fm MISOSYS, Inc: It needs to be defined in a DSEG as a "DS". Then it won't take up space in the file; it would behave just like the result from EDAS.

MRAS and PRO-WAM /APPs

Fm John Foote: In May of 1987 I purchased the Load 80 disk from 80 Micro to get PRSET/APP from Hardin Brothers' program in that issue titled "Pop Up Printer Codes". This is an excellent program and I find it extremely useful with PRO-WAM to set up my fancy Qume printer. My problems with PRSET/ASM and my solutions are as follows:

(1) The source code did not have a transfer statement following the END statement. Since the PRO-WAM example uses one, I added it. (2) The source code statement up to the ORG is identical to PRO-WAM's example except that it uses the alternate version. This I changed to the PRO-WAM version. (3) Using these changes I could not get the source to assemble correctly with a transfer point under MRAS using -GC, or -CI or even no switches at all. Each attempt showed an error at the initial header computation to install zeroes. Finally, using -GC, and with the header computation revised, the program would assemble, but PRO-WAM refused it, with the error message, "Not a PRO-WAM application". I finally used -GC and -NH and now the program runs perfectly.

The MRAS manual says that an ORG'd program will not assemble if it contains REL segments. Apparently this applies to *GET statements as well. For instance my next attempt was to assemble Brothers' program "Linein" from "Prefab Programs" in the January 1987 issue of 80 Micro, page 109. This program uses *GET to assemble a subroutine. I have not been able to assemble the program using any switches. The program will assemble if the *GET statements are deleted. So perhaps someone would comment on my problems!

Fm MISOSYS, Inc To John Foote: Concerning difficulty in using PRO-MRAS to assemble Hardin Brothers' PRSET application for PRO-WAM, here's the skinny.

PROWAM applications are neither executable command files (those normally generated by an assembler such as PRO-CREATE) nor relocatable modules (such as generated by an assembler such as PRO-MRAS). APPs are highly structured core-image files more akin to a CP/M .COM file than anything. These core image files have absolutely no load address information, are always loaded into memory by the PRO-WAM (or PRUN) loader at a fixed spot, and always have a fixed entry address. With proper source code, such a file can be directly assembled by PRO-CREATE if certain assembler switches are specified. The one needed in PRO-CREATE is the "-CI" switch which generates a "core-image" file. In order to generate a similar file directly by PRO-MRAS, you do need to specify the switches "-GC -CI -NH". You did find that out. The "-GC" overrides the normal REL output mode and switches MRAS to the CMD file mode. The "-CI" then specifies core image. The "-NH" is needed to suppress the header record normally generated for the CMD file structure (this is done automatically by PRO-CREATE

when -CI is specified but not automatically by MRAS). MRAS is a little more complicated and the switches become a little complex.

Using *GET or *INCLUDE files was irrelevant to your problem. Also, in APP files, a transfer address operand on the END statement is not needed. Since the purpose of that is to specify the transfer or entry address on the type 02 record of a CMD file, since APP files are core image and don't use such a record structure, the transfer operand is not needed. We show that in the PRO-WAM manual only to illustrate where the transfer is going to be; however, it will always be 2800H.

PaDS

PaDS and DOS LIB modules

Fm Kevin R. Parris To MISOSYS, Inc: The PRO-PaDS documentation says "SYS6/SYS and SYS7/SYS, are PDS structures". On TRSDOS 6.2.1, 'PDS(DIR) SYS6/SYS.LSIDOS:0' returns the message "File is not a PDS!". Why?

Fm MISOSYS, Inc: A PDS structure doesn't necessarily imply one identical to that used by our PaDS utility. In fact, the two are virtually identical; however, the DOS files have a separate member name index which is located in SYS1/SYS. Our PaDS utility had to combine the structure of the library partitioned data set and the member name index into one. That's why the PaDS utilities cannot operate on the system LIB files. Extract a PaDS's Front End Loader (FEL) and its member directory, and the remainder is identical to that of the system's LIB files.

Just as an FYI, PaDS and PRO-PaDS are discontinued products. We could not justify re-developing PaDS to work with the extended dating scheme of the x.3 releases of the DOS.

Fm --jjkd-- To MISOSYS, Inc: Shucks, another classic bites the dust. Maybe if we colorized the manuals? Naw...

Fm MISOSYS, Inc: Well, we have no manuals left. I also can't see supporting a revision to handle the extended date. Too few folks bought it in the past. You just don't continue to support products which don't sell. That's why I never developed PaDS 2.0 which would have allowed access from any program transparently.

PRO-WAM

External access of ADDRESS

Fm Edgar R Rondeau To Roy Soltoff: Can address have a file appended to it? E.G. with dBase III I download files

from the mainframe and append them using sdf. I wondered if address will do likewise.

Fm MISOSYS, Inc: Well, you could always append more records if they were organized like the ones already there - and if you corrected the NUMBER-OF-RECORDS in the header record. Don't forget, any of those PRO-WAM data files can be operated on by other languages - if you care to write the code.

Fm Edgar R Rondeau To MISOSYS, Inc: Roy, how can I correct the number of records from COBOL?

Fm MISOSYS, Inc: You can "correct" the number of records from any programming language which permits disk I/O to files. You read the data, update it, then write it back. That usually requires random access which, I'm sure, COBOL provides. The location for the "number of records" is documented in the PRO-WAM manual. It is repeated in every section covering an application. The "Table of Contents" of my PRO-WAM 2.0 manual shows an entry for "ADDRESS/DAT Technical Specifications" as being on page 45. Turning to page 45 about the middle of the page, I read, "Relative bytes 0-2 contain the number of data records contained in the file..." You did get a manual with your PRO-WAM, didn't you?

Fm Edgar R Rondeau To MISOSYS, Inc: Thanks Roy, I'll give it a try. COBOL uses relative files, but they take no more space than sequential files. I.E. If you declare the file to be 120 bytes that's all it will use to store the record not 256 as basic does.

SuperScripsit and PHRASE/APP

Fm Fred Sinder: Will the key stroke repeat feature record entered keystrokes like SuperScripsit? In other words, can I use it to automate a number of Multiplan operations I have to do twice a month?

Fm MISOSYS, Inc: SuperScripsit? Not without the CTL255 filter previously discussed on our CompuServe forum and implemented by Lynn Sherman. [that's also contained here in this issue. -ed] Multiplan? Probably. You can check out MP by seeing if it will function from the KSM feature of the DOS. PRO-WAM's PHRASE application will provide more flexibility than KSM.

How exactly to EXPORT

Fm Reinaldo D. Verson To MISOSYS, Inc: I have two problems remaining: (1) there is a discrepancy between what <CTRL><P> displays and the actual applications, (which is not serious, because I know what keys to press) and (2) IMPORT/EXPORT.

I must confess that I never understood EXPORT/IMPORT even from PRO-NT0. Will you please send me an actual STEP BY STEP example of the keystrokes to be sequentially used? I am using ALLWRITE 4. I would like to be able to transfer to my Allwrite program, elements from some of the

applications, such as from CARD. I don't want any explanation; just one example worked out.

Fm MISOSYS, Inc To Reinaldo D. Verson: If I could understand what you're talking about when you discuss the keys used to invoke applications, we'd be in better shape. You have me puzzled. My hunch is that you have zapped some of the applications in question. The names displayed in the PRO-WAM menu (via <CTRL-P> come from the header record of the application. If you mess with that, then you will get strange results. Using DEFAULTS is the correct method to alter what applications get installed into memory. Now if you can't figure out what is wrong - something is - then please send me a disk with your working PRO-WAM on it. I need to see at least the PROWAM/CMD file and the WAM0/APL library file.

On to the issue of export. That's easy. Here is an example for ALLWRITE. You are in ALLWRITE preparing to type a letter and positioned at where the heading is to go. You want to send the letter to someone whose address is in your ADDRESS file. So you pop up PROWAM via <CTRL-P> then invoke UNIVERSAL via <F3> and type "head" in response to the "Application ?" prompt. HEAD must be moved over to your WAM0/APL library for this example. You then issue a SEARCH for "SMITH", find the right one, then press <ENTER>. the export is done automatically and you are back in ALLWRITE seeing the heading being brought into your text as if you typed it yourself. That's quite easy, but since HEAD controlled most of the export, you didn't get the flavor of it as you should.

Here's another. You previously jotted down a note to Smith in a CARD file record the other day while you were running some other program. Now you want to bring that note into the letter to Smith without re-typing the note. So you have the ALLWRITE cursor at the place for text insertion and you are in insert mode. Press <CTRL-P>; select the CARD file, search for the note, then press <CLEAR-RIGHT-ARROW>. You will see a cursor at the upper left corner of the window. You move this around via the ARROW keys so that it is positioned at the upper left corner of the text (text must be envisioned as a rectangular region). When you have the cursor in the right spot, press <CTRL-B> to mark the beginning of the block. Then move the cursor via the ARROW keys to the lower right corner of the text block that you wish to export. You can choose to depress <ENTER> at this point or <SHIFT ENTER>. The difference is that <ENTER> will export line by line but an <ENTER> is added after the last character of each line. If you use <SHIFT ENTER> to close the text block, the marked lines will be export as if they were one continuous stream of characters. I suspect that this would be better for ALLWRITE - unless the text were a table. In any event, when you close the block, the CARD window will go away and you will be back in ALLWRITE with the marked CARD text magically piped into your letter. I trust you find these examples valuable.

Fm Reinaldo D. Verson To MISOSYS, Inc: Thanks a million for your comprehensive letter. All problems have been solved. I tried the two examples mentioned by you for EXPORT, and they work beautifully. In fact, just for the fun of it, I used HEAD to lift the two headings on this letter, so that I did not have to type them. From now on it will be a

question of practice and experimentation. Nevertheless, when you have time, please send me a practical example of IMPORT.

For your information, this is the way I have set up my system. On drive 0 I have ALLWRITE with LS-DOS 6.3, Electric Webster, Dotwriter, and an AUTO DO=INIT/JCL file which installs PROWAM and PRUNS CALENDAR, which in turn leads me to BRINGUP to see the assignments for the day. The calendar, with its asterisks, also reminds me of future assignments. Then, I go back to DOS and press *AL for ALLWRITE, to handle my correspondence and continue working on the manuscript of my new book. All the PROWAM files are kept on drive 2 (double-sided, 360K) and my data file is kept on drive 3, also double sided.

It goes without saying that I am delighted with PROWAM. I take this opportunity to congratulate you for creating such a wonderful tool, and to thank you for your magnificent cooperation.

Fm Reinaldo D. Verson To MISOSYS, Inc: I thought I had reformatted all bad PROWAM disks, but I found this bad one which I am enclosing, in case you care to find out how part of PROWAM remains in it, although it does not install PROWAM and does not show in the directory. I am sending it to you just for research purposes.

Fm MISOSYS, Inc To Reinaldo Verson: The problem you had was caused by doing a SYSGEN after you had installed PRO-WAM. You can't do that; but PRO-WAM can't guard against it. Page 12 of the manual discusses this. The reason why you can't is that PRO-WAM installs the four resident applications into banked memory which cannot be configured. Thus part of PRO-WAM was already installed when you re-booted that system disk but the part in external memory was not. Since PRO-WAM checks to see if its Device Control Block (DCB) is already installed before it tries to install itself, it found it. If that happens again, you need to re-do your configuration. BOOT while holding the <CLEAR> key (after entering date and time) which inhibits LS-DOS from loading your CONFIG/SYS file. Then manually enter any commands to customize your configuration then SYSGEN. Only install PRO-WAM afterwards.

PRO-WAM and Mister ED

Fm Reinaldo D. Verson To MISOSYS, Inc: On November 23 I ordered Mister ED as an addition to my PRO-WAM. Today I received a package, and was very disappointed to find that somebody had made a mistake and sent me the disk and manual for PRO-NTO. It took me several hours to find out. I assumed that when the manual referred to PRONTO, it meant PRO-WAM, but since none of the applications would work with PRO-WAM, I decided to try with an old backup of PRONTO and it did work.

I was going to return all material to you, but decided to let you know first, and get an authorization to return it. Anyway, this application is not what I expected. If you can find a way to give me a credit for what I paid for Mister ED, I would apply it toward the purchase of other programs. If not, please send

me the right material and I will return the wrong one immediately.

I am particularly concerned with the fact that I am stuck with the wrong utility. I ordered Mister ED for PROWAM, and I received Mister ED for PRONTO. The reason I don't want Mister ED is that I do not know machine language yet, although I am studying. I would not know what to do with Mr ED but I could use a data base program.

Fm MISOSYS, Inc To Reinaldo Verson: Your letter discussed receipt of Mister ED and implied it was the wrong package because it was for PRONTO. That just happens to be the old name for PRO-WAM; every Mister ED application works quite well with PRO-WAM - even release 2. I believe I scratched a note to you about this which may have crossed in the mail with your 12/23 letter. Every Mister ED application works *once you place the desired application into a library*. I'm sure you found that out by now.

I don't think you need to know machine language in order to use Mister ED; however, if the package does not *feel right* for you, please return it. We can credit you the cost of the package. We need a copy of the invoice (or at least the invoice number). We can then apply that credit towards LB or issue you a refund.

PRUN and JCL abort

Fm MISOSYS, Inc: Stephen Javna reported to us that when he used PRUN to invoke an application from Job Control Language (JCL), the JCL job aborted after the application was terminated with a <BREAK>. We researched the problem and offered him a solution. Seems that when we worked up the PRUN1/FIX patch to PRUN reported in TMQ II.ii, we broke the graceful exit during JCL operation. PRUN2/FIX in this issue's *The Patch Corner* corrects that problem.

Removing PRO-WAM

Fm John Tollini To MISOSYS, Inc: I have been working on a way to work out a boot up configuration with HD drivers, com/dvr, diskDISK, and room for RAMDISK/DCT (XLR8er version of MEMDISK) and PRO-WAM. If I load PRO-WAM first to force the HD drivers & com/dvr high, they trap pro-wam. (I thought I understood that PRO-WAM must be removed before SYSGEN like MEMDISK/RAMDISK)

Fm MISOSYS, Inc: PRO-WAM must be removed. You cannot SYSGEN alternate memory. Perhaps it would be best for you to use a STARTUP/JCL rather than a SYSGEN?

Fm John Tollini To MISOSYS, Inc: For some reason I didn't see the obvious solution. <your suggestion>. I'll have to give it a try and see if the tradeoff for boot time is excessive. With all the comments about 80 Micro's change maybe everyone should send them a nice letter telling them to cancel and send the money to you for a TMQ subscription instead!

Fm MISOSYS, Inc: I think more and more folks are using the AUTO DO facility to initiate a STARTUP/JCL when they are not prone to excessive re-BOOTS. It also avoids the problem of forgetting what your configuration is and the ease in adjusting to a different DOS release is quite useful - although no more are expected.

Another CARDX use

Fm Michael Rogers: I have used CARDX to create pop up help screens for BASIC. Besides having a help window which in no way interferes with the BASIC program you are writing, PRO-WAM's import/export feature allows examples from the help windows to be transferred directly into the program you are writing. I have found this particularly useful when using seldom used statements and functions. Instead of digging through the manual, CARDX's search function allows quick access to the information I need and often the example field on the card provides me instantly with program material. Placed on a ramdisk, a search for an item on the last card in a file of over 140 cards (extended memory beyond 128K recommended) takes only about 5 seconds. Also all references to a particular statement, keyword, or function are easily found, often more efficiently than by using the existing index in the manual. In the past, I rarely used help files but the interactive nature of PRO-WAM certainly made the effort of creating my BASIC help cards very worthwhile.

I have also used PRO-WAM to create pop up help files for 'LeScript'. Those familiar with this word processing program know that it has an alternate screen for help files. However, if you want to use the alternate screen to edit two text files at once (two copies of the same file in memory at once can be handy), you lose access to the help files. PRO-WAM allows you to have pop up help files and have two text files on alternate screens. Making these help windows was fairly easy, using import to transfer the existing 'LeScript' help file data onto PRO-WAM cards. (This can be done with minimal editing.)

Here's Mr. ED

More powerful applications for your **PRO-WAM**. This pac includes an editor for your every need. You get:

- **DED:** Edit disk sectors on any drive
- **FED:** Edit file records in any disk file
- **MED:** Edit any page of memory in any bank
- **TED:** A pop-up full screen text editor
- **VED:** Edit the video screen; gives cut and paste
- **CARDFORM:** Populate CARD with a form
- **DOLOAD:** Brings DOSAVEd files back to the video
- **REGENBU:** Shrinks BRINGUP/DAT file

Mr. ED ~~59.95~~
Now only \$39.95! + \$3 S&H

The LDOS 5.3 upgrade kit is now available to take your Model III or 4 (in 3 mode) to the year 2000. LDOS 5.3 provides complete media compatibility with LS-DOS 6.3, the newest Model 4 DOS released by Logical Systems, Inc. With LDOS 5.3, you can add 12 years to the life of your software. Just look at these improvements over version 5.1.4!

Only \$34.95

DOS Enhancements:

- Date support through December 31, 1999: time stamping for files.
- LDOS frees up 14 additional file slots for data disks.
- On-line HELP facility for DOS and BASIC—117 screens of help.

LIBRARY Enhancements:

- New FORMS. lets you change printer files parameters.
- New SETCOM. lets you change RS-232 parameters.
- Improvements to LIST add paged displays, full-screen nex mode, and flexible tab expansion.
- MEMORY displays directory of terminate and stay resident modules.
- SYSTEM lets you direct the SYSGEN to any drive: adds a flexible drive swap subcommand: SMOOTH for faster disk throughput.
- DIRectory display enhanced with time stamps, file EOF, and more.
- We've also improved: AUTO, COPY, CREATE, DEBUG, DEVICE, DO, FREE, KILL, and ROUTE: and added CLS and TOF commands.

UTILITY Enhancements:

- We've added TED, a full screen text editor for ASCII files.
- LCOMM now gives you access to LDOS library commands.
- PATCH supports D&F patch lines with REMOVE capabilities.
- DATECONV converts older disks to the new date convention.

BASIC Enhancements:

- Editing now includes line COPY and MOVE.
- Very flexible INPUT@ added for screen fielded input.
- We've added a CMD"V" to dump a list of active variables with values—including arrays.

For \$34.95 (+ S&H), the LDOS 5.3 upgrade kit includes a DOS disk and documentation covering the enhancements. Specify Model 3/4 or MAX-80. If you don't already own LDOS 5.1.4, get our USER manual for \$33 additional.

The Hardware Corner

Notes on XLR8er

XLR8 Installation questions

Fm Jacques: I have a Model 4 with 64K and two disk drives and am interested in purchasing an XLR8er to speed things up a bit, but I am not sure how well it works. The manufacturer claims it doubles clock -speed and comes with 256K memory for use as a Ramdisk. Could anyone share his/her experience with me? And since I am not very technical, how difficult is it to install?

Fm Mark Mueller To Jacques: I installed an XLR8er on an old (1984) non-gate-array model 4 in about 30 minutes. They give you everything you need, including a new RF shield to mount it on. The only problem I had was trying to locate 150 microsecond 4614's to replace the stock memory. All that was around me within reasonable driving distance were 4264's which are WRONG (they use a different refresh cycle interval and totally screwed me up. Don't trust Radio Shack, either. They had 4264's in packages marked "4164". Anyway, the speedup is amazing and definitely worth it.

Fm Bill Otten: Does anyone know if the xlr8er board available from H.I.Tech Research of Houston Texas will allow or is compatible with the GT180 hi res graphics board designed to mate with the SB180fx single board computer? The SB180fx single board computer and the GT180 graphics board were featured in byte magazine articles authored by Steve Ciarcia. The xlr8er board is an add on to the TRS-80 Model 4 computers and the advertisement for the board claims compatibility with Ciarcia peripheral boards. Any help with this would be greatly appreciated.

Fm Bill Otten: Does anyone know if there are any problems in shoehorning the hi res graphics board from MicroLabs along with the xlr8er board from H. I. Tech into a 4P. I would like to have the xlr8er board inside the 4P rather

than in the modem slot. Also is there an EZ mod which will transform the 4P modem into a 1200 or 2400 baud card, without radical uses of either money or hardware change?

Fm --jjkd-- To Bill Otten: I seem to recall somebody saying that they managed to get the xlr8er and a graphics board into a 4P, but it required adding a spacer to the socket. The result was very cramped.

The Model 4P internal modem should be trashed. It can't be upgraded, and is pretty much brain-damaged as it is (non-Hayes). There is a 1200 baud internal Hayes compatible available from Teletrends for, I believe, under \$200.

Personally, I would go with one of the miniature external portable modems, like the Migent Pocket modem (1200 baud), or the Worldport (available in either 1200 or 2400 baud). The 1200 baud versions are available for less than \$200, I don't know how much the 2400 baud is going for. All these run on a 9V battery or AC adapter.

Novation is purported to have a modem called the Parrot or some such, 1200 baud, Hayes compatible and runs on the juice it can steal off of the RS232 leads of the computer. This beast was announced several months ago, but I know of nobody who has successfully ordered and received one.

That's my shot at it. If I were you, I'd take things one at a time. First, get the xlr8er board. Put that in, work it around the Microlabs board if you have that already, and deal with that.

If you don't have a Microlabs graphics board, and do want graphics, and have to decide between the Microlabs and dealing with the GT180, next get the GT180 manual. If you expect to do anything other than write **all** your own software, go with either the Microlabs or RS graphics boards, period.

On the modem, see what the Worldport 2400 is going for from the mail order places, and then decide between that and a 1200 baud version. Note that almost everything is adding 2400 baud access, and CIS charges no more for 2400 baud access as compared to 1200 baud. You can probably make back the cost difference in short order. Note also that this modem can be moved to almost any future computer you get.

Fm MISOSYS, Inc: I directed the question of XLR8er installation into a 4P with a graphics board to Bob of H. I. Tech. His opinion was that there is not enough room to mount the XLR8er board onto the 4P's motherboard if a graphics board was already installed; the XLR8er must go into the modem slot. It is possible to install the XLR8er onto the 4P's motherboard if no graphics board is installed thus allowing the modem slot to be used for a modem. Although they supply no instructions for doing that operation as of this writing, they will be investigating the installation particulars. Essentially, it requires mounting the board on standoffs similar to what is needed to mount a graphics board onto a 4P's motherboard.

Fm Mark Mueller To Bill Otten: I don't have the necessary info on the Ciarcia boards, but the XLR8er has an S-180 compatible bus on it and the grapevine has it that they will work if you bring the bus off the board (there is a connector to do this.)

Fm Gary Phillips: I puzzled over getting the XLR8er into the 4P without giving up the modem slot, and concluded that the only way to do it was by putting the XLR8er in the modem slot anyway and moving the modem elsewhere in the case. It seemed like a lot of bother for a little gain, since I rarely move the machine (I have a lap-top CP/M for portable use) and I use an external 1200 baud modem now anyway. The internal modem was merely on standby backup, so now it's back in the original box on a shelf.

Fm --jjkd-- To Bill Otten: In response to your plea, I am replying to all your questions. Be forewarned that the reason I didn't answer previously is that I don't have the intimate **personal** knowledge of these pieces acquired through owning this stuff. This info is the result of various things I have gleaned over the years.

The xlr8er board adds 256K to the existing 128K in the computer, allowing 384K total as a maximum. The resulting RAM can then be supported with extensions to the system @BANK interface. Programs can then access the added RAM via @BANK. Note that most non-enlightened programs may not look for RAM beyond the first banks available in a "all-RS" Model 4. The added RAM can be used by a number of MISOSYS products, and via ramDISK programs.

The xlr8er does not claim compatibility with the Ciarcia peripheral boards. The xlr8er advertisement indicates the availability of an option to support the SBX180 bus, which the Ciarcia boards also claim to support. Whether or not they both have interpreted the (third party yet) bus in question accurately enough to allow operation is probably going to require purchasing both and trying it.

Perusing the technical documentation for both products would only provide sufficient information to detect a major incompatibility if one exists.

Fm Jeff Joseph: I, like some of your other readers, have an XLR8er and was mildly impressed with the speedup. I say mildly because I've got an inferiority complex now that the MicroMint (from BYTE) has a new SB-180FX that runs at 9.216 MHz. It should be possible to XLR8 the XLR8er to at least this speed on the Model 4 by modifying the RAM timing circuits, using the faster 64180, using 120 ns RAMs, and replacing the XLR8er's crystal with a 18.432 MHz one. I have the Seatronics 8 MHz speedup kit installed in my Model 4D, so I can provide the instructions for performing the RAM timing modifications to your readers if any of them want to try it (I have the mod for the 4P's also). I haven't yet done it myself as I am awaiting the delivery of my second XLR8er (I want a backup on-line in case I fudge it up).

XLR8 Installation

Fm MISOSYS, Inc: Since many of you are trying to decide whether the XLR8er is for you, I have been given permission from H.I. Tech to re-print a portion of their User Manual which covers the XLR8er installation. After reading the material which pertains to your machine, you will be in a better position to understand just what is involved. Obviously, some skills are needed since Tandy's machines are not

designed for add-on boards (except perhaps the 4P). Here then are the instructions.

MODEL DIFFERENCES

There are three types of Model 4 motherboards that the XLR8er Board may be installed on with the types listed as below. Type 1 - The original motherboard with the Z80 socket in the lower left of the circuit board, and is considered NON-GATE ARRAY. The model number 26-1069 is located on the bottom of the machine. Type 2 - The new GATE ARRAY motherboard with the Z80 socket in the upper left of the circuit board. (This includes some Model 4s and all Model 4Ds) Model numbers 26-1069A and 26-1070. Type 3 - The motherboard in the Model 4P. (Gate array and non-gate array). Special Instructions for installing with Graphics Board available on request.

Determine your type of motherboard and then proceed to that section of this chapter to get the installation procedure.

WARNING: Before attempting to install the XLR8er board make sure your computer is unplugged from the wall socket to avoid electrical shock. Also, during the installation process, avoid any contact with the high voltage portion of your CRT as this section could still produce a potential shock. If you feel unsure about being able to install the XLR8er ask a technically oriented friend to help you out.

In all of the installation instruction sections you are instructed to examine the speed of the RAMS that are currently in your system. The dynamic RAM chips in your Model 4 must have an access time of at least 150ns or you cannot run the XLR8er board at full speed. If you need some 150ns RAM H.I. Tech or TANDY can provide them at a reasonable cost.

It may also be necessary to replace one other chip associated with keyboard functions, labeled 74LS245P. Its location is given in your installation instruction. The replacement chip is 74HCT245 and is a higher speed chip than the 74LS245.

On both the MODEL 4 and the MODEL 4D systems, it is necessary to install a new RF shield in order to complete the installation of the XLR8er board.

TYPE 1 MOTHERBOARDS (26-1069)

Note: All instructions are given as viewed from the rear of the Model 4. Additional "hints" from current owners will be listed at the end of this chapter and are very helpful.

1. Remove the screws on the underneath side of your computer holding the top molding on the base.
2. Make sure the doors to your floppy disk drives are in position to clear the top cover when it is removed. (some types are best left open, others left closed).
3. Carefully lift up the top portion of the housing (Be careful as the CRT is contained in this part of the enclosure. Be especially careful not to let the yoke of the CRT bump against anything). Once it has cleared the top of the disk drives, lay it

over on it's side being careful not to stretch the wiring harness going to the CRT.

4. Remove the screws holding the RF shield in place, and then remove the RF shield.

5. Carefully pry the Z80 from its socket and save it in case you need to use it again.

6. Check the dynamic ram chips and assure that they are at least 150ns parts. They will have a -150 or -15 on the chip after the RAM part number. Check the 74LS245P chip and replace with 74HCT245P if needed. It will be located to the left of the Pal chip and if two are there, it will be the furthestmost one left of the Pal chip. (the Pal chip is in socket U-72)

7. Now check the revision number of your motherboard. If it a revision "C" or "D" the following step is required. Find the jumper wire on the motherboard that is labeled as "W3" on each end. (This wire runs from U31 on the left portion of the motherboard to U25 on the right portion). This wire needs to be grounded for proper operation of the XLR8er. The easiest way to ground W3 is to remove a small portion of the insulation and attach a wire to insert under one of the mounting screws holding the mother board in place. If "W3" does not run from U25 to U31, then do not ground it!

8. Plug the 40 pin ribbon cable connector into the Z80 socket being careful not to bend under any pins. Be sure that the ribbon is bent per sketch.

9. Install the 6 #4 screws provided, in the holes surrounding the opening in the back of the RF shield. Secure these screws with #4 nuts provided. The screws should be inserted from the inside of the RF shield, facing outward toward the back of the unit. The #4 nuts will act as stand-off spacers for the cover plate which will mount over the screws after the RF shield is reinstalled on the system.

10. Install the NEW RF SHIELD in your system, allowing the 40 pin cable to exit through the large port in the new RF shield. Check to see that the motherboard housing is as far forward as possible; the mounting brackets have some adjustment in them. Insure that they are pushed as far forward as possible.

11. Remove the protective sheeting, if present, with the diagram on it prior to installing the XLR8er board. Install the XLR8er board on the RF shield cover plate using the four nylon spacers to allow for separation. XLR8er board MUST BE MOUNTED ON THE FIBERGLASS SIDE (NOT THE COPPER SIDE) of the cover plate. It should be installed using the 4 holes marked for the MODEL 4. The connectors (headers) on the XLR8er should be aligned so that they are facing toward the right side of the MODEL 4 AS VIEWED FROM THE BACK OF THE BOARD. The diagonals are marked for the different models.

12. Once the XLR8er board is in position, plug the free end of the forty pin ribbon cable connector into the empty Z80 socket on the XLR8er board, being careful not to bend under or break any pins on the connector.

13. Check all connections and be sure to plug in the power supply plug on top of the mother board. Tighten all screws and nuts that might have been loosened during disassembly.

14. Your XLR8er board is now installed.

15. CAREFULLY set the top back on the computer (again be careful of the CRT yoke).

16. Put the screws back in the base of the computer and you are through.

17. Refer to the appropriate software section now to boot up on your new XLR8er board.

TYPE 2 MOTHERBOARDS

Note: All instructions are given as viewed from the rear of the Model 4 Gate Array and Model 4D (26-1069A and 26-1070)

1. Remove the screws on the underneath side of your computer holding the top molding on the base.

2. Make sure the doors to your floppy disk drives are in position to clear the top when removed. (Some are best left open, some left closed.)

3. Carefully lift up the top portion of the housing (Be careful as the CRT is contained in this part of the enclosure. Be especially careful to not let the yoke of the CRT bump against anything). Once it has cleared the top of the disk drives lay it over to the side being careful not to stretch the wiring harness going to the CRT.

4. Remove the screws holding the RF shield in place, and then remove the RF shield. Unplug the disk drive power supply plug on the top of the motherboard.

5. Carefully pry the Z80 from its socket and save it in case you need to use it again, it is located in the upper left corner of the motherboard.

6. Check the dynamic ram chips and assure that they are at least 150ns parts. They will have a -150 or -15 after the RAM part number if they are. Check the 74LS245P chip (socket U-77) and replace with 74HCT245P if necessary.

7. Plug the 40 pin ribbon cable connector into the Z80 socket being careful not to bend under any pins. Be sure that the ribbon is bent per sketch.

8. Install the 6 #4 screws provided, in the holes surrounding the opening in the back of the RF shield. Secure these screws with #4 nuts provided. The screws should be inserted from the inside of the RF shield, facing outward toward the back of the unit. The #4 nuts will act as stand-off spacers for the cover plate which will mount over the screws after the RF shield is reinstalled on the system.

9. Install the NEW RF SHIELD in your system, allowing the 40 pin cable to exit through the large port in the back of the

shield. Check to see that the motherboard housing is as far forward as possible, the mounting brackets have some adjustment in them. Insure that they are pushed as far forward as possible.

10. If necessary, remove the protective sheeting with the diagram on it prior to installing the XLR8er board. Install the XLR8er board on the RF shield cover plate using the four nylon spacers to allow for separation. The XLR8er board **MUST BE MOUNTED ON THE FIBERGLASS SIDE (NOT THE COPPER SIDE)** of the cover plate. It should be installed using the 4 holes marked for the MODEL 4D. The connectors (headers) on the XLR8er should be aligned so that they are facing toward the right side of the MODEL 4D AS VIEWED FROM THE BACK OF THE BOARD. The diagonals are marked for the different models.

11. Once the XLR8er board is in position, plug the free end of the forty pin ribbon cable connector into the empty Z80 socket, being careful not to bend under any pins on the connector.

12. Install the RF shield cover plate with the XLR8er board facing the inside of shield, and the connectors on the XLR8er facing the right as you view the system from the back. Reconnect the disk drive power supply plug on top of the RF shield.

13. Your XLR8er board is now installed.

14. CAREFULLY set the top back on the computer (again be careful of the CRT yoke).

15. Put the screws back in the base of the computer and you are through.

16. Refer to the appropriate software section now to boot up on your new XLR8er board.

TYPE 3 MOTHERBOARDS

The XLR8er board fits in the modem slot on your Model 4P computer.

1. Remove the case on the 4P by removing the 6 Phillips head screws holding it on the chassis. The first 4 screws are the beige colored screws around the front bezel of the computer. The last 2 screws are under the carrying handle. Additional screws may be located near the I/O ports. Set the screws aside in a safe place for now.

2. Turn the 4P up on its screen now and pull straight up on the case. Be careful of the keyboard as you pull off the case as it might fall as the case is being removed.

3. Once the case has been removed, the pan assembly in which the main PC board is encased must be removed. There are 4 screws on each side of the pan assembly. Remove these 8 screws and set them aside for now.

4. Gently pry the two halves of the pan assembly apart. The disk drive ribbon cable which is connected to the computer

board will have to be removed before you can fully open up the pan assembly to gain access to the circuit board.

5. With the pan assembly opened up far enough to gain access to the chips on the circuit board, gently pry the Z80 chip from its socket (U-47) and set it aside for safe keeping.

6. Plug one end of the 40 pin ribbon cable supplied with the XLR8er board into the socket you just removed the Z80 from being careful to note the position of pin 1 on the socket and on the ribbon cable connector. Also be careful not to bend under any pins on the connector as you plug it in.

7. Now slide the XLR8er board into the internal modem slot with the I/O connectors towards the inside of the slot (near the internal modem plug, refer to fig 1.3).

8. While you have access to the motherboard check the RAM in your 4P and make sure it is 150ns RAM. (It will be located in sockets U-133 to U-139 and U-153 to U-159) If it is not the XLR8er board will not be able to run at full speed. Check for the chip labeled 74LS245P and replace if necessary. It will be adjacent to the ram chips and may be in socket U-117.

9. Close the pan assembly slightly until the other end of the 40 pin cable that you plugged into the Z80 socket reaches the empty 40 pin socket on the XLR8er board. Carefully plug the 40 pin ribbon cable connector into the socket.

10. Now re-connect the DISK DRIVE RIBBON CABLE CONNECTOR (this is the part that everyone forgets) and close the pan assembly.

11. Follow the above instructions in reverse; put the case back on the chassis and you're done.

Ciarcia Buss Option

Fm MISOSYS, Inc: For those of you who may be interested in the expansion port, here's some excerpts from the *XLR8er User's Manual* which covers this very topic. The kit which covers the Ciarcia Buss Option is available from H.I. Tech. Their last published price for the kit was \$10.

If you plan to use the I/O expansion port, plug one end of the 40 pin ribbon cable onto the "J1" header. Feed the appropriate cable out of the computer enclosure through the feedthrough holes in the bottom of the enclosure.

USING THE EXPANSION PORT

The expansion port brought out on the 40 pin ribbon header is of the same pinout as Ciarcia's SB180 (Tm) as featured in *Byte* (Tm) magazine. All the signals needed for experimental circuits or add on circuit boards that Ciarcia has designed can be plugged into this header. The only difference in the expansion port as compared to the expansion port on the SB180 is that the EXP SEL0[^] and EXP SEL1[^] mapping has been changed to avoid any conflicts with the I/O map of the Model 4. EXP SEL0[^] goes true (low) any time an I/O address of 40H to 5FH is accessed. EXP SEL1[^] goes true (low) any time an I/O address of 60H to 7FH is accessed.

J1 - EXPANSION PORT

Signal		Pin #		Signal

XLR8er Capabilities

Fm Marc A. Williams To MISOSYS, Inc: I am starting to investigate sources for add-ons for my venerable Model 4. My objective is to make my TRS-80 an "ultimate" machine, given the limits of the 8-bit technology, rather than mess around with IBM etc. I'm waiting for MicroVAXen to come down into my price range - this new computer every few years stuff takes its toll after awhile.

As I've been pouring over the TMQs, I've noticed quite a number of mentions of the XLR8er CPU board and the Alpha Tech memory expansion. I gather that these two items are the most popular in their respective categories. Are they the easiest to support in the context of LDOS/LS-DOS x.3 (I hate hard to manage kludges)? Also, do you know who still sells the Alpha Tech memory board? If no one does anymore, do you know of anyone who would sell a schematic?

I understand that the XLR8er has memory of its own, but I get the impression that it isn't accessed via the port-based bank switcher the stock Model 4 uses (the Alpha Tech board does, though, eh?). Also, I'm looking at some real memory eating applications, and 1Meg vs 256K will be a factor for me.

Fm MISOSYS, Inc To Marc A. Williams: Glad to see you're going to continue with your Model 4; we have, and still support, many good products for that machine. And when you're ready to take the plunge into MS-DOS, we can help you there, too.

You have the facts a little wrong on the XLR8er board. It comes provided with a software interface to the @BANK SVC of the DOS and a RAM drive software module. The interface code installs into low RAM. The XLR8 board has 256K of RAM and a 64180 CPU chip. It is installed by removing the existing Z80 CPU and plugging a DIP header cable into the vacated socket. The other end of the cable is at-

tached to the XLR8. The CPU can speed up your machine considerably. We ran some tests on one of our machines and gained a 60% increase in speed. This was on a newer 4P which ran a good 4MHz to begin with. Older slower machines may see even more a dramatic increase in speed. Thus, the XLR8 board gives more RAM (256K in addition to your existing 128 for a 384K total) and a faster machine. Total addressable RAM is 384K with banks 0-10 (11 banks switchable).

The Alpha Tech memory board can handle up to one Meg. It is installed by removing the Z80, removing all of the existing memory chips and discarding them, adding new 256K memory chips, soldering about 5 wires, clipping the 16 capacitors wired to the existing RAM sockets if installed, then inserting the previously removed Z80 into a socket on the board which is now plugged into the Z80 socket. Since the Model 4 only has 16 sockets, that accounts for 512K using the 256K memory chips; to get to 1Meg, you have to piggy-back another 16 chips onto the socketed set and interconnect two like numbered pins across the second set - a risky but workable exercise. The AT board then gives you up to 1 meg with up to 31 banks switchable. It's sold by Anitek.

We have both installed (not in the same machine, of course). The XLR8 is most certainly the easier to install - in a 4P!. I would not recommend the Alpha Tech board to someone who is uncomfortable in soldering onto his Model 4 motherboard. Also, we are now selling the XLR8 board (\$245 + \$5S&H).

A better FIXBANK?

Fm Jim Gaffney: Finally got my replacement keyboard installed in my Model 4 today and was able to check the FIXBANKA. I got the same results that you did. The program ran fine, but when I tried to load PROWAM into the top bank, I got a "no memory space available". Then I tried SAID and it showed me that only two alternate memory banks were available.

Don't know what to tell you other than the fact that I DID check the object code after assembly against the listing that was sent me and the two files were identical. Conclusion?? Maybe I'll stick with Michael Carter's original version of FIXBANK, as I wasn't having any problems with it. Just what problem was the source file from H.I. Tech supposed to correct?

Fm MISOSYS, Inc: Check out this issue of TMQ. We are providing Rex Basham's HIBANKS/ASM installation module which replaces the FIXBANK module provided with the XLR8er board. Rex's implementation uses about 50 bytes less of low memory space.

AT Patches for XLR8er? No!

Fm John Tollini To MISOSYS, Inc: Here's a question from another direction - Would your AT patches work okay with an XLR8er and is there any way to reserve low memory space for PRO-WAM? I'm sure someone must have figured out the best way to configure a system to put things where they wanted (high/low).

Fm MISOSYS, Inc: AT patches are strictly for the AT board. There is no way to reserve low memory space short of some specialized programming. Load PRO-WAM first.

RAMDISK and DATECONV

Fm Mark Mueller: Has anyone else noticed that the RAMDISK in the XLR8er package dates files as "1980" when written directly to ramdisk (they should be 1988)? It maintains correct dates when COPY is used to transfer files. Could be a bug. Has anyone else noticed that yet? May be time for a call to Houston.

Fm MISOSYS, Inc: Are you sure that COPY will produce a file with a date of 1988? My hunch is that you may have to DATECONV the RAMDISK. Easy to do if you install the whole thing with a JCL.

Fm Gary Phillips To Mark Mueller: The XLR8er RAMDISK driver formats a TRSDOS 6.2.x disk. If you want to use LS-DOS 6.3 dating facilities, you need to do a DATECONV on the RAMDISK after it is formatted. I install the RAMDISK, backup the SYS overlays to it, then DATECONV, and finally install it as the system disk by using a small JCL file. After DATECONV, the 1988 dates and times appear in the RAMDISK directory just as on any other 6.3 disk. (If you are not going to put SYS overlays on the RAMDISK, you may need to use the undocumented CS parameter of DATECONV to get it to work; try it and see.)

Assistance needed

Fm Hugh Fuller To Roy Soltoff: I thought I would add to the growing discussion surrounding both the XLR8er board and Aerocomp hard drives. I have a gate-array model 4P that I have recently fitted with both an XLR8er and Aerocomp 20 meg drive. The improvement in performance due to the new board is truly remarkable, and well worth the price. I use LDOS 5.3 for much of my work, so tried assembling the MODELB/III file, and setting up a boot disk as described in TMQ 2.1. The model III ROM loads some but not all of the time. I have therefore reverted to using the file M3BOOT/CMD supplied by H.I.Tech and run from an LS-DOS disk. This means 2 disks for LDOS boot-up, but is more predictable (in my hands anyway), and really is little extra effort.

I too have had problems with the Montezuma Micro Hard Drivers for the Aerocomp 20 meg drive, both under LDOS and LS-DOS. The only real trouble under LS-DOS is in interfacing with diskDISK as discussed last issue. My temporary solution (till MM come up with an answer) is to DDFORM 2 dummy /DSK files (3 cylinders using option 1) on the boot floppy, and make them active drives during configuration. After system transfer to the hard drive I can then substitute useful /DSK files into these drive slots. I find it works (so far!!) without hitch.

The main problem has been with the hard disk driver under LDOS. Despite following their (near absent) instructions I have been able to format the disk under LDOS only on 3 occasions (out of about 50!!!). The low level format utility

supplied by MM works fine, but on attempting to add the directory format using LDOS FORMAT utility the system hangs up with garbage on the screen. I have formatted successfully using LS-DOS, and can transfer LDOS programmes to the drive as well. Subsequently LDOS will recognise the disk, run a directory, and run programmes from it, but any attempt at writing to disk produces a system hang-up. I have tried speed settings for the XLR8er, and MM have sent 3 sets of drivers so far, but with no improvement. Both the LS-DOS and CP/M drivers work on all areas of the disk, so I do not think it is a hardware problem.

I have written Montezuma Micro and hope they come up with a fix. In the mean time I am running under LDOS with the hard drive as a source of programmes, but using floppies for data file storage. I would be interested to hear any comments from you or others, and wonder whether the XLR8er may have something to do with it.

Using the 64180's MLT opcode

Fm MISOSYS, Inc: One of the features which can be utilized after installing an XLR8er, is the hardware multiply operation of the 64180 CPU - the processor used in the XLR8er. For a more detailed look at the 64180, check out David Hall's article, *The HD64180 CPU*, which was published in *THE MISOSYS QUARTERLY*, Issue II.i (Summer 1987). The CPU supports four 8x8 multiply instructions which takes 17 t-states. These instructions are MLT BC, MLT DE, MLT HL, and MLT SP. The actual operation will multiply the low-order register value by the high-order register value placing the result back into the 16-bit register pair.

There are at least three distinct places in LS-DOS 6.3 which can be altered to directly utilize this hardware multiply. Being tight on time here, I passed on some of the information to Rex Basham who assisted me in working up the actual patches.

Two of the three functions in the DOS should be obvious: the @MUL8 and @MUL16 supervisor calls, although the latter may not be immediately obvious. The third spot is within the video driver; it has its own special purpose multiply by 80 which is used to multiply a video row number by 80 adding in the column number to arrive at an offset address for a particular location on the screen.

The easy alteration of the DOS is to its @MUL8 SVC which multiplies register E by register C with the result returned in register A. Actually, since the SVC handler always loads the value found in register C into register A in its processing, the @MUL8 routine really multiplies E by A. There are no provisions for feeding back an overflow condition; thus, it was very easy to patch in a MLT DE instruction so the revised @MUL8 routine is:

```
LD      D, A
MLT     DE
LD      A, E
RET
```

The @MUL16 routine actually winds up multiplying register pair HL by register A, for the reason cited above (reg_A is loaded from reg_C). A 16-bit by 8-bit multiply can be easily

derived from an 8x8 multiply through some simple mathematics.

$$HL * A = (H * 256 + L) * A = HA * 256 + LA$$

Multiplying an 8-bit register by 256 is exceedingly simple; it just becomes the high-order register of a 16-bit register pair. The resulting @MUL16 routine is then:

```
LD      E, L
LD      D, A
MLT     DE      ;Reg E now has
LD      A, D    ; low-order result
ADD     A, L    ;Reg L now has
LD      L, A    ; mid-order result
ADC     A, H    ;Accumulate CF
SUB     L       ; into reg_H
LD      H, A    ;Result into HLA
LD      A, E
RET
```

Altering the video routine was duck soup. It used the @MUL16 svc since the result of row*80 could exceed an 8-bit value. But the maximum value could only be 23*80=1840. Therefore, a simple:

```
LD      L, 80
MLT     HL
```

did the trick. I even had to NOP out 4 bytes of code

There are two patches which make up the LS-DOS revisions. One, MLT1/FIX is applied to BOOT/SYS; the other, MLT2/FIX, is applied to SYS0/SYS. Naturally you will have to re-boot after applying the two patches in order for them to take effect.

Finally, although I would have liked to perform some testing of the speedup these modifications provide, I didn't have the time (in spite of a faster Model 4). I'll leave it for the next issue of TMQ. Perhaps someone else may do that legwork as well as study the statistics associated with a reduction in t-states for these routines. Enjoy

FDR6AT

FDR6AT and dump speed

Fm Duane Saylor To Michael Jacobs: I have been tinkering with your FDR6AT the past week and have found why it would abort when run from a /JCL file. BANK 0 was not being restored when the bank loading was complete. Though this did not crash the system it caused a running JCL to abort. I also changed a few other things in the Dump and Restore subroutines and was able to restore a 855k memdisk in 58 seconds. I then changed the sector interleave in TRSFORM6 from the normal 8 to 16 and was able to almost cut that time in half. The time with the 16 sector interleave is 30 seconds. Probably the only way to shorten it any further

would be to incorporate a multiple sector read into TRSHD6/DCT. When I get the Western Digital controller info, I may just try that. Since the hard disk turns at 3600 RPM and there are 32 sectors per track, if you could read all 32 sectors in one revolution, you could in theory read 3547 sectors (855k RAMDISK file) in 2 seconds. However I suspect the Western Digital Controller and a Z80 at 4 MHZ may not be able to get the data that fast.

Fm --jjkd-- To Duane Saylor: I guarantee it won't. There is a 2K buffer on the controller, so reading four sectors at a time with an interleave of 4-1 might be pretty quick. You'd have to hard code this stuff into the FDR program, as it would be extremely difficult to get the system driver to do this, consequently degrading performance with anything other than FDR.

Disk Interleave

Hard disk interleave

Fm Duane Saylor To --jjkd--: I finally acquired a used Tandy 5 meg disk drive for my model 4 which already has 3 80 track double sided disk drives (1 of them is a 3.5 inch drive). I also have the ALPHA Technology 1 meg ram board of which I use 855K as a memdisk. I use a driver that was uploaded by Michael Jacobs in March of 1986. He also modified FDR to Dump and Restore the memdisk. I have been tinkering with FDR the past week and the best I could do when Restoring the memdisk was 58 seconds for 3457 sectors. That figures out to around 60 sectors per second. Since the hard drive is turning at 3600, I was only able to read 1 sector per revolution. My analysis of TRSFORM6/CMD indicated that the interleave was 8 sectors. I changed that to a 16 sector interleave and it dropped the load time to 30 seconds. There is also the possibility of multiple sector reads (though the driver does not support this) and I might try that approach after I get a complete copy of the Western Digital Disk Controller documentation.

Fm --jjkd-- To Duane Saylor: Very interesting! Did you seem to notice any other changes in performance with the new interleave? Sounds like a change to 16-1 might be helpful for other operations, e.g. if the system loader is missing 8-1 and might pick up 16-1.

Are you changing the interleave on-the-fly? If not, it'll be hard to re-create the file locations and fragmentation unless they're the only files on the source and destination partitions.

Fm Duane Saylor To --jjkd--: The files on the disk are all together at the bottom of the cylinder. I haven't been using it long enough to have any fragmentation yet.

Since I still have one hard drive partition formatted with an 8 sector interleave I decided I could run a few tests on my 5 meg system. I copied an 855k file with the following results: (The SI is an abbreviation for Sector Interleave)

Source	Destination	Time
8 SI	16 SI	1 min 48 sec
16 SI	8 SI	1 min 45 sec
16 SI	16 SI	1 min 15 sec

The following were times for a 30K file copy

Source	Destination	Time
8 SI	16 SI	7.13 sec
16 SI	16 SI	5.82 sec
Mdisk	8 SI	4.06 sec
Mdisk	16 SI	2.87 sec

Fm --jjkd-- To Duane Saylor: Yep, that's pretty conclusive. The system is keeping up with the 16-1 interleave and getting two sectors per rev, but not with the 8-1 interleave (only one sector per rev). How about trying one partition with a interleave between eight and sixteen? The interleave does not have to be a factor of the sectors/track figure (though it makes the math and code easier). Maybe it can keep with three sectors per rev. That would be another 50% improvement.

Fm Duane Saylor To --jjkd--: OK, will give that a try. I am not changing the interleave on the fly, because I have no idea how I would do that. What I did was patch TRSF0RM6/CMD to change the interleave and then I reformatted selected partitions.

Fm Adam Rubin To --jjkd--: I've been following this discussion on HD interleave, and thought I'd try a few tests of my own. I took one partition (one head) of my RS 5-meg HS, formatted it with various interleaves, and ran the following tests. In all tests, :0 was the HD partition with the DOS, :1 was the HD partition under test, and :7 was a 64K (i.e. 57K) Memdisk. All times are in seconds, and were measured using the system's RTC, since I didn't see that anything being done here would affect its accuracy.

Test #1: Read cylinder 0, sectors 0-31 of HD partition (256 times). Test #2: Copy a 54K file from the HD to Memdisk (16 times). Test #3: Copy a 54K file from Memdisk to the HD (16 times). Test #4: Backup a single 54K file from the HD to Memdisk (16 times). Test #5: Backup a single 54K file from Memdisk to the HD (16 times). Test #6: Load a program from the HD into memory (X'3000' to X'FFFF'), 16 times.

Inter-leave	1	2	3	4	5	6
4	145	103	105	129	187	82
6	50	105	107	132	190	86
8	40	64	65	122	193	89
10	44	57	58	87	197	93
12	52	60	62	86	186	95
14	62	63	65	89	145	100
16	74	69	70	94	153	77
18	79	71	72	97	155	53
20	88	73	76	100	158	54

So, it's pretty clear that the ideal interleave for each of these operations is different. It also looks like it takes two steps on the table for each test to go from the longest to the shortest

value for that operation. (I'd expected a sudden drop, as each application suddenly "caught the interleave.")

What I'm having trouble doing, though, is coming up with a more general (and more practical) conclusion. What do these results tell us about the best interleave for everyday HD usage (or the best interleave given the primary usage of a partition)?

Fm --jjkd-- To Adam Rubin: First off, test #5 tells us nothing meaningful. Since BACKUP always runs with sector verify on, it will never achieve better than one sector per two revs performance. The minor differences are the result of the degree of "phase difference" between the alternating write-read sequences.

The "round edges" may be a result of interaction between the system overlays and the hard drive. Did you have all the system overlays SYSREsed (or preferably ALTREsed or Oded with buffering off)?

It might also be due to the system being very close to missing the interleave at that rate, and task processing during RTC ticks is causing fairly frequent misses. The slightly looser interleave leaves enough time so that the tick can almost always be processed without missing the interleave. Disabling interrupts would tell you for sure, but you'd need a "real" clock to time things then.

Since READ seems to reliably keep up with an interleave of eight, reformatting the hd with an overall interleave of eight would work well in conjunction with OD. Without OD, it looks like 18 for partitions that have lots of /CMD files, and 10 for everything else.

Fm Adam Rubin To --jjkd--: Thanks for your comments! I've modified my testing procedure a bit, and came up with some more results. For all tests, :1 is the HD partition, :7 is Memdisk (with Backup, and the JCL to run the tests), and overlays 1, 2, 3, 10, 11, and 12 were SYSREsed. (Memdisk was using the extra banks, so I couldn't put the overlays there.) All times are given in seconds, as measured by the RTC.

Test #1A: Read cylinder 0, sectors 0-31 of :1 (256 times). Test #2A: Copy a 46K file from the HD to Memdisk (16 times). Test #3A: [omitted]. Test #4A: Backup a single 46K file from the HD to Memdisk (16 times). Test #5A: [omitted]. Test #6A: Load a program from the HD into X'3000'-X'E7FF' (16 times).

Inter-leave	1A	2A	4A	6A
4	143	79	89	65
6	48	81	91	67
8	39	45	84	71
10	43	39	55	74
12	51	42	52	77
14	60	45	55	79
16	72	50	60	60
18	77	51	62	38
20	86	55	65	41

Test #1A doesn't resemble too many "real-world" applications, since it doesn't do anything with the data that it read. Still, it's probably the best approximation of OD, from what I know about that program. (Yes, the Mark IV Collection is on my wish list!) I guess TRSFORM6's normal interleave of 8 would be best there.

Otherwise, 18 does indeed look like the best choice when there's lots of /CMD files, and 10 for the other partitions. I think I'll try reformatting :0 (LS-DOS 6.3 and frequently-used programs) with an interleave of 18, and see what happens.

Printers

DMP-2100p

Fm H. Brothers: One of the pins on my DMP-2100p is misfiring; it doesn't seem to be striking as hard as the others, if at all. Is there any alternative to paying RS the \$300 they want for a new print head? (seems like a lot for a printer that may soon be replaced).

Fm Ed Weber To H. Brothers: Lacquer (NOT paint) thinner is a good solvent for DM inks. It is a more powerful solvent than alcohol so be careful of plastics and finished surfaces. I doubt that the 1,1,2-trichloroethane in tuner cleaner will dissolve the ink residue but a shot of tuner cleaner which contains lubricant might help to replace the lubricant removed by the lacquer thinner. I've cleaned the head of my C. Itoh with lacquer thinner and have observed no ill effects. I have been curious about the solvent system in DM inks but I've never been interested enough to look it up or to do an analysis.

Fm H. Brothers To Ed Weber: Thanks for the advice, Ed. I hadn't ever heard of using lacquer thinner on print heads; sounds like an interesting experiment.

Fm Gary Phillips To H. Brothers: I have observed with the older dot-matrix printers we have on our VAX system that sticky print-wires often unstick when the ribbon is replaced and the printer "exercised" a bit. Better quality ribbons contain lubricants that help keep the print head working smoothly. I have heard that cheap ones sometimes are short on such ingredients. I have also heard WD-40 recommended for loosening up a sticky print head. You don't apply it directly to the head, but rather spray it on an old ribbon and then run the ribbon through the printer while the built-in print test is repeating over and over.

Fm H. Brothers To Gary Phillips: That's an interesting approach, Gary, but I don't think it would work in this case. The print wires are about 1" long and, as far as I can tell, nothing's jamming them in the little slot where they wait to strike at the paper. Maybe some lubricant back where the firing mechanisms are will help, though.

Fm --jjkd-- To H. Brothers: WD40 also works good for cleaning print heads, but watch out for splashing! WD40 with ink in it is nasty stuff to clean off. If there is a removable rubber cover on the print head "snout", remove it for access to the major length of the pins. Note that this could also be a driver (electronic rather than mechanical) problem.

Don't lube the firing mechanism, but do lube all the pin guides. Note that WD40 really isn't the right thing for this kind of service. There was a special "high pressure grease" available as a repair item for the LP III (26-1156 I think). Cost about a buck and a half for a little plastic tube.

Fm MISOSYS, Inc: This discussion reminds me of the time my Radio Shack Line Printer V (26-1165) started tearing ribbons. I took a look at the printhead and found one of the pins sticking out a little. Thinking that the pin feed guide was all gummed up, I took off the rubber snout and soaked the head in alcohol. It cleaned it up all right, but still the pin kept sticking out and tearing ribbons causing the whole thing to jam up.

Thinking I had a bad print head, I checked National parts at 817-870-5618. The LP-V print head was part number AXX0909. I was just about to order one when I asked the price. Turns out that a new printhead from National Parts was \$435.69 (yes, that's over 400 bucks!). Of course, if I took the old one in to a store I could exchange it for a re-built printhead for only \$121.91.

Those options didn't look to bright for me. The LP-V is used here at MISOSYS for printing our invoices; yes, it's connected to my AST Premium/286. The LP-V is the best printer we have for printing multi-part forms and still leave the 4th part readable. So I took the printhead apart and found that the retainer spring (that's my term) which returns the print pin into the head after firing was broken into two pieces. Without a usable spring, the pin wouldn't retract.

Well I had an old LP-III in the back up on the shelf. That had a printhead which was similar to the LP-V except that it had fewer pins. So I took apart that print head and found it used the identical springs. I took a spring from the LP-III printhead and installed it in the LP-V printhead. Worked like a champ. Anybody need a LP-III without a printhead?

DW-II Printer

Fm Joel Koch: I am trying to interface a (old) DW-II printer to an MS DOS PC and I cannot find a switch or option to disable performing a line feed on a carriage return. Any help would be appreciated.

Fm MISOSYS, Inc: There is no switch on the older DW-II printer. There is a software solution (among others). With the DW-II powered up, send the following sequence from BASIC:

```
LPRINT CHR$(27);CHR$(21);;
```

This will disable the automatic line feed on carriage return which the printer will perform. It will be disabled until either

(1) you turn the printer OFF then back ON, or (2) you send CHR\$(27);CHR\$(22);.

Problems with Okidata

Fm Mark Reed To Roy Soltoff: Your subscribers may be interested to learn about my experiences with Okidata, the Mt. Laurel, New Jersey company that makes several kinds of printers and other computer equipment. I am enclosing a copy of this letter on diskette, in the event that you would like to publish it. It's long, but I think that the information it contains could be useful to many people.

Last year I bought an Okimate 20 from a local computer store. I decided on that model for several reasons. First, it was inexpensive, even when I added the cost of my IBM-compatible "Plug 'n' Print" module to the base price. Second, it could print in color, which meant that I could do screen dumps from my Tandy 1000 SX. Third, it had a 24-wire printhead, which meant that its "correspondence quality" font was excellent. And finally, it was made by Okidata, which I knew to be a reputable company. I bought the printer and its interface module on Friday afternoon, expecting to have an enjoyable weekend familiarizing myself with the printer and its features.

However, as I unpacked the printer and its accompanying hardware that evening, I found that I had been given an IBM PCjr "Plug 'n' Print" module by mistake. Since the PCjr controls printers through a serial port, and my 1000 SX controls printers through a parallel port, I could do nothing more with the printer than set it on my desk. I read through the instruction manual and waited for the store to re-open on Monday morning.

When I returned to the store with the PCjr module, I got a big surprise. The store did not give me a PCjr module by accident; they gave me one because that was the only kind of module they sold. (Never mind that I had specifically asked for an IBM PC-compatible module with a parallel cable!) If I would bring in my printer, they were sure they could "rig something up." I declined and asked for my money back instead; then I managed to find the correct "Plug 'n' Print" at another computer store in another town. It cost a little more there than it should have, but it was worth it just to get the printer operating.

Then everything was fine for about five months. I didn't use the printer very often during that time, but whenever I did, it worked beautifully; its type font was crisp and clear, it was quiet, and it didn't use ribbons as quickly as I had thought it might. And then, during a printing job, I noticed a fine white line running horizontally through every line of type. I examined the page closely and came to the conclusion that a pin on the Okimate 20's printhead had stopped firing. I tried cleaning the printhead according to the instructions in its manual, but that didn't help; one of the 24 pins seemed to have died. Since I had only used two and a half ribbons since I bought the printer, I called Okidata's 800 number to find out what was wrong.

The customer service representative I spoke to after coming off hold told me that she didn't know much about the

technical aspect of Okidata's printers; she transferred me to a technician. The technician told me that yes, I had a problem, all right; one of the 24 pins had stopped firing. He said that the printheads were good for over a million characters, and since I had printed nowhere near that number, my printhead was defective. He transferred me to a different customer service representative. She told me that since my printhead was defective, Okidata might be able to send me a new one for free. She had no authority to do that, but she gave me the telephone number of someone who did.

I dialed that number, even though it was a toll call, and spoke to the man she had referred me to. He said that it sounded like I had a defective printhead, and that he would authorize his staff to send me a new one immediately. "In fact," he told me, "I'm going on vacation next week, and while I'm gone, my office is being moved; so you can be sure that we'll be getting that printhead right out."

A month and a half went by, with no printhead from Okidata. In the meantime, my Okimate 20 printhead, which had at least been usable, lost four more dots and had to be retired. Whenever I needed a print-out from my Tandy 1000 SX, I unplugged all the cables from my TRS-80 Model III and moved its Gemini 10-X printer onto the other computer desk. Then, when I needed a print-out from my Model III, I reversed the procedure. I temporarily re-programmed most of my software to use the Gemini 10-X control codes instead of the Okimate 20's. I wrote a letter to the man I had spoken to, asking if there had been any problem; he never replied to it. I telephoned the man's office; he was in a meeting but would call me as soon as it ended. (It must have been a mighty long meeting, since he had still not returned my telephone call one week later.) Finally, I made a person-to-person call and asked him what was going on. He said that he was wondering the same thing, and he promised me that he would "go bug Logistics about it" that very same day.

It has been almost five months since my Okimate 20 printhead broke, and I have received nothing from Okidata in that time. I finally broke down two weeks ago and sent a money order to Okidata Supplies to buy a new printhead; the salesperson on the telephone said that orders that were accompanied with money orders were shipped out within twenty-four hours after they arrived. I expected the order within days, but today, after ten days had passed with no printhead, I called the company to find out when it had been shipped. To my dismay, I found that it had not been shipped. In fact, my order had not even reached them. I found out that the address I had sent the order to -- the address that Okidata printed on the order form that Okidata supplied with my printer -- has not been current for some time. Never mind that no one alerted me to the address change as I found out the prices and handling cost over the telephone. My order will be forwarded to the correct address "eventually," but until then, my inexpensive printer will remain an expensive paperweight.

I placed another order today, to the current address (which I verified with two different people), for another printhead. They say I should have it early next week, but I'm a little skeptical. And I have a little advice for people who are considering Okidata computer equipment. If you can buy it from dealers who know what they're talking about and who stock replacement parts, go ahead; you'll probably be quite

pleased. But if you buy it from a mediocre dealer because it's inexpensive, and expect to get the replacement parts yourself from Okidata, forget it; go buy something else. Dealing with the Okidata staff is about as pleasant -- and as productive -- as banging your head against a brick wall.

Power Supplies

Astec Power Supply

Fm: H. Brothers: I need to replace a Model 4 old-style (65 watt, longish-rectangle board) power supply in a friend's Model 4. A while back, there was a company selling Astec AC9355's, AC9365's, and AC9335's for a less-than-Tandy reasonable price. Unfortunately, I've lost their address and don't remember where I found them. Can anyone provide any leads?

Fm Gary Phillips To H. Brothers: Jameco had them in their most recent sale flyer (September, I think). Also Timeline was advertising them in Byte. One or the other probably still has a few.

Fm --jjkd-- To H. Brothers: Timeline is (800) 872-8878 US, (800) 233-9977 CA. Jameco is (415) 592-8121.

Service Manuals

Radio Shack Manuals

Fm Adam Rubin: It's a little-known fact that Radio Shack has a service manual for just about everything they sell, from portable radios to computer systems. Their service manuals can be ordered from National Parts, or through any RS store. Part number is "MS" followed by the item's catalog number, with the first part of the catalog number padded to three digits.

The service manual for the 4P (cat. 26-1080) is therefore MS2601080, and when I got mine three years ago, it was about \$35. It includes schematics, part lists, troubleshooting lists, timing diagrams, boot ROM flowchart, and the complete theory of operation for both non-gate-array and gate-array models, plus a reprint of the OEM service manual for the disk drives.

Basically, it's a very complete and thorough description of the 4P's hardware, and I've found it an invaluable resource.

The other books on my "4P reference shelf" are the usual ones -- DOS manuals for 5.x and 6.x, both RS *Model 4 Tech Ref Manuals*, Roy's *Programmer's Guide*, and *Programming the Z80* by Rodney Zaks. (And the LSI and MISOSYS periodicals, plus a lot of messages from this forum and heaps of printouts of object code and disassemblies!)

Fm --jjkd-- To Kevin R. Parris: There is very little different between the service manual and the tech manuals, though the service manual will often include more detail on servicing some subassemblies, like the floppies. The service manual also includes full size schematics, whereas the tech manual schematics are usually reduced somewhat in size (but rarely content).

You can get a service manual for the 4D and gatearray 4 by ordering a MS-260-170 from RS National Parts (827) 870-5611.

Smartwatch

4D & Smartwatch

Fm Duane Saylor To Donald R. Arrowood: Mark Nowell worked out the following instructions for installation of the SmartWatch in a gate array Model 4.

1. Connect a jumper from pin 26 to pin 28 on the SmartWatch. This provides 5 volts for pin 28 of the SmartWatch.
2. Bend pin 20 of SmartWatch so it will not go in pin 18 of ROM socket.
3. Jumper pin 20 to pin 14 of SmartWatch. This provides a ground for pin 20 of the SmartWatch.
4. Remove Boot ROM B/C from the Model 4. This will be U4 and is the top ROM of the 2 ROM's located about two inches to the right of the Z-80 chip. The ROM should be a Motorola MCM68A364.
5. Insert SmartWatch into ROM socket with pins 1,2,27 & 28 hanging over the end of the 24 pin socket. Pin 3 of the SmartWatch plugs into pin 1 of the ROM socket.
6. Bend pin 18 of the Boot ROM so it will not insert into pin 20 of the SmartWatch. Insert ROM into SmartWatch Socket such that it is aligned with the ROM socket on the main circuit board. Note that pin 1 of the Boot ROM will be in pin 3 of the SmartWatch socket which in turn is in pin 1 of the socket on the main circuit board.
7. You must now connect a short piece of wire from pin 18 (The pin you bent out in step 6 above) of the B/C ROM to A11 (Address line 11). This can be done two ways: (A) Locate the jumper JUST TO THE RIGHT of U4, the ROM B/C socket. Remove the jumper, and attach the short wire to the BOTTOM of the three posts, then replace the jumper. (B) Locate the 74LS244 Octal Buffer in U2, and connect the short piece of wire to pin 18 of this chip.
8. This completes the installation of the SmartWatch in a Model 4 Gate Array computer.

4P & Smartwatch

Fm Mark Mueller: I just installed a Smartwatch in my 4P using the instructions in the DL's. My 4P is a non-gate split-personality beast with a green screen and "new keyboard", but old motherboard. It has a 2732 Boot ROM with pin 20 jumpered to ground (pin 12). I installed the Smartwatch, fired up the 4P only to be greeted by "No smartwatch present". Trouble was that jumper soldered on the ROM. I cut it and all is fine. May save someone else the hassle.

Model I Harddisk

Model I Harddisk

Fm Bill Schaper: I need some help installing a Hard disk to a Model I. It was connected to a Model III when I bought it and I have all the manuals etc. for that computer. I bought it for my Model IV, as used it successfully with LDOS drivers in both Model III/IV modes. Since my Model I was my first computer, I want to keep it. The Model IV, however, was sold (less hard-drive). The drive is what I would consider a standard 5meg unit (with a 10 meg Tandon installed). The cable worked fine with the Model IV, but I'm not sure where to connect it on the Model I. The Model I manual(s) are useless, as they make no mention of a hard drive unit (pre-hard disk, I suppose). Any help would be appreciated.

Fm Pete Granzeau To Bill Schaper: As you might note, the Models III and 4 both have a 50-pin I/O connector, to which you could attach the HD cable. Unfortunately, the Model I had a 40 line connector on the back, and extended out the side of the expansion interface. Radio Shack sold an interface unit of some type for the Model I so it could use the hard drive, but I'd guess they're long since gone from stock.

Fm --jjkd-- To Bill Schaper: You need the Model 1 Hard disk adapter kit. I believe that it was Radio Shack part number 26-1131. You can call RS National Parts at (817) 870-5662 and order both the Owner's and Service manuals for that part, or perhaps a complete replacement cable adapter assembly. If you are at all handy, you could probably wire wrap up a converter in a few hours without too much trouble.

The Model 1 drivers from RS have never been redone to handle drives larger than 406 physical tracks per surface. If Roy's RSHARD package is available in a Model 1 version (Roy?), that would be the way to go for drivers, as I'm not sure that RS will have the diskette listed as an available part under the 26-1131 number.

Fm MISOSYS, Inc: Since RSHARD uses some of the features added to 5.3 LDOS (like the CFLAG\$, and the x.3 directory structure for formatting), it would be un-usable with a Model I 5.1.4 release of LDOS. I suppose it could be patched, but we don't have the time for that.

Fm Bill Schaper To --jjkd--: Thanks for the reply. It's times like these that make the \$65-100 a month worth it! I'll

give 'em a call and hope they have the required Model I kit for the Hard Drive. If not, perhaps I can "scare" one up on Compuserve.

Fm Ray Pelzer To --jjkd--: I opened one of those things up once... it was just a STRAIGHT-THRU line-for-line board in that box except for about 3 transistors which seems to be in there to invert the signals of 3 of the lines.

3.5" floppy drives

Model 4 Floppies

Fm Richard Watkins: I just installed two double sided floppies in my Model 4. I was just wondering if the Model 4 controller will work with 3.5" double sided (720k) floppies. For that matter will the m4 work with the high density (1.2 meg) floppies you hear about for the IBM clones?

Fm MISOSYS, Inc: Most, if not all, 3.5" floppies will work properly with the Model 4 floppy disk controller (FDC) and DOS. That's because the 3.5" drive emulates an 80-track 2-sided 5.25" floppy. I had absolutely no problem connecting a Citizen 3.5" drive to a Model 4 here whereas it took me hours to get it working on my AST machine. Of course, I also had to BUY a new DOS for my AST as MS-DOS 3.10 doesn't support 3.5" drives; you need at least 3.2 for that!

The high-density 5.25" (1.2Meg) or the 3.5" (1.44Meg) floppies won't work as the controller is not designed to operate at their data transfer speed. Regular floppies work at a transfer rate of 250 kHz whereas the high-density floppies work at a data transfer rate of 500 kHz - the same as the old 8" drives. Now if you had one of the switchable FDC boards, the ones that switched between the 1Meg clock and the 2Meg clock - you probably could write a driver to operate the high-density floppy drives. Joe may have a better feel for that.

Fm Jeff Joseph To Roy Soltoff: About 3.5" drives on the Model 4; I have two such Aerocomp drives, and they work perfectly with NO modifications to hardware or software. I don't know if they're different from the NEC drives Duane Saylor has (TMQ 2.1, page 39). I run them under LS-DOS, LDOS, and Montezuma CP/M. In fact, they'll format 86 tracks with no problem. I also boot from 3.5" floppies! Just install the drive as :0 as you normally would (after transferring the DOS to a 3.5" disk configured as some other drive first). I have been running mine for 7 months.

By the way, I'm from Virginia Beach! Lived there for 17 years (before I joined the service, which is the only reason I'm someplace like ND. But at least I got lotsa time to read *The Programmer's Guide* while sitting atop of missile silos, and get paid for it too!). Glad to read you liked our city.

The Patch Corner

General Information

The following information should be read before you type into a file, any of the patches noted in *THE MISOSYS QUARTERLY*.

It is unfortunate that our printer prints the letter "O" and the number "0" almost identically. Unless we utilize a filter to "slash" the number zero, the two are difficult to distinguish. However, when it comes to patches, all is not lost. In an LDOS 5 or TRSDOS 6 direct patch, the letter "oh" is not used in the patch code (it may appear in comments which are lines beginning with a dot). The direct patch format of TRSDOS 6 which we use in our patches is:

```
Drr,bb=xx xx xx xx xx xx ...
Frr,bb=xx xx xx xx xx xx ...
```

The patch is usually a pair of lines. The first line begins with the capital letter, "dee". This is immediately followed by the "rr" field (which stands for record). The "rr" field is always two hexadecimal digits. Actually, it can be a 4-hexadecimal digit number if the file to be patched has more than 256 sectors. Hex digits use nothing but the numbers zero through nine and the first six letters of the alphabet: A,B,C,D,E,F, or a,b,c,d,e,f. The record number is immediately followed by the "bb" field (which stands for byte). The byte field is also two hexadecimal digits - just like the record field. This is immediately followed by an equal sign, "=". The equal sign is immediately followed by the first patch byte (the "xx" shown above). The patch byte is again two hexadecimal digits. Where more than one patch byte is included on a line, it is separated from its predecessor by a single SPACE. The line is terminated with an ENTER.

TRSDOS 6 and LDOS 5.3 patch formats use a "find" line record. This is used to verify that the file being patched is actually the file you want patched. All of the bytes noted in the "F" line or lines must be matched in the file before any of the "D" patches will be utilized. The second line of the pair begins with the letter "F" which stands for FIND. The next six

positions are identical to the preceding "D" line. Following the equal sign on the FIND line are pairs of hexadecimal digits which should align themselves with the preceding line.

So far, the letter "oh" is not used. The only place outside of a comment line where you could find the letter "oh" used is if instead of showing the patch bytes as a series of hexadecimal pairs, it was depicted as a string. A string could be used if one was patching a string of displayable ASCII characters. For instance, the patch:

```
D03,14="This is a new string"
F03,14="extra space for what"
```

would replace the string, "extra space for what", with the string, "This is a new string". Strings are shown within double quotes. That's the only place where a letter "G" through "Z" could be used.

Also, even though TRSDOS supports the colon notation to put more than one patch line on the command line (e.g. "PATCH TEST (D01,27=56:F01,27=65)"), it does not support the colon separator when used in a FIX file (it does support a semicolon which is used under LDOS to signify a trailing comment); LDOS 5.3 supports a colon separator both in a command line patch and a fix-file patch. In order to conserve space in *THE MISOSYS QUARTERLY*, we may logically print more than one FIX line on a printed line; however, always use a hard <ENTER> for the colon when typing in a FIX file for TRSDOS 6.

If you use the **FIX??/TXT** file from the **DISK NOTES** corresponding to this issue, please separate out the individual fixes which you need by use of any text editor you find convenient to use. A program, UNARC/CMD, is provided to automatically split the file into its constituent fixes. If you are typing in the fix files from this printing, do NOT type the lines `"/*%=====` and `filename/fix"`.

TRS-80 Software and Hardware from MISOSYS, Inc.

General Information

MISOSYS specializes in quality tools and professional software to enhance your microcomputer system. We have been serving the TRS-80 community since 1978. Our products are used worldwide by the discriminating professional, the casual computer user, as well as by the devoted hacker. In keeping with this tradition, we have professional products for the TRS-80 Models I, III, 4, 4P, 4D, as well as MS-DOS and PC-DOS based machines.

The information in this flyer represents all the printed matter we can send you concerning a software package. If this still does not answer all of your questions, please write or call; however, there is no other printed material we can send you.

If you are ordering from the United States outside of Virginia, you may place telephone orders direct to our order desk toll free by calling 800-MISOSYS (that's 800-647-6797 for you digital folks). Please, we cannot handle customer support or questions of a technical nature on our order line. Any telephone query not relating to an order must be directed to 703-450-4181.

No-questions-asked RETURN policy

Here's a policy which should minimize anyone's fears of trying out one of our products. Any MISOSYS product except those designated as CLEARANCE, purchased directly from MISOSYS may be returned **within 30 days from the invoice date** for a full refund of the product purchase cost. Returns must be in a "like-new" saleable condition and be accompanied by a copy of the original invoice. So if you're not sure whether a MISOSYS product will serve your needs, try it out. If it doesn't fit, return it.

TRADEIN Policy

Here's a useful policy. We will accept a tradein of any other non-MISOSYS commercial product as 50% of the purchase of an equivalent MISOSYS product. Got an ALDS and wish you had our relocatable macro assembler? Trade it in and get PRO-MRAS for \$44.98. Got PFS-FILE or PROFILE and wish you had LB? Trade it in and save \$37.47. How about EnhComp for half price? Trade in your BASCOM or Alcor MultiBASIC! Got somebody else's ratty disassembler? Trade it in and get PRO-DUCE for half price. Got a Radio Shack Series I (or II) disk assembler. Trade it in for EDAS or PRO-CREATE at \$37.48. Want an LDOS 5.3 complete with manual for \$32.48 plus S&H? Trade in your DOSPLUS, NEWDOS80, or MultiDOS! Note that you still pay full S&H charges.

Policy on Disk Refreshes

The charge to recut the disk(s) for any one of our products is \$10 + S&H. The S&H charges are \$2 for US, \$3 Canada and Mexico, \$6 elsewhere. This charge pertains to the same release version. Upgrades are priced separately.

THE MISOSYS QUARTERLY subscriptions

Take an *LDOS QUARTERLY*, an *LSI Journal*, and a *NOTES FROM MISOSYS*. Blend them together into a professional magazine format filled with the latest information on MISOSYS products, programs and utilities, patches, significant messages from our Compuserve forum, and articles on programming and what do you have? Why *THE MISOSYS QUARTERLY*. Each issue of TMQ has a significant product special available only to subscribers. That means, you will invariably recover the cost of a subscription by taking advantage of these specials. Not only that, TMQ will keep you up to date with information, news, and announcements concerning our entire product line and related machine environments.

Subscriptions must be prepaid. We'll start your's with the current issue. Subscription cost varies by rate zone as follows:

- A = \$25; United States via 3rd class bulk mail
- B = \$30; Canada, Mexico, or United States via 1st Class
- C = \$32; Columbia, Venezuela, Central America via AO Air
- D = \$35; South America, Europe, & North Africa via AO Air
- E = \$40; Asia, Australia, Africa, Middle East via AO Air

Out of print TMQ's available

We are providing back issues of *THE MISOSYS QUARTERLY* via copier reprint. The price is \$10 plus \$2.50 S&H in the U.S. and CANADA. For foreign zone D, the S&H rate is \$3.75; zone E is \$5.00. That price will be in effect also for regular back issues. Back issues will be available ad infinitum through one means or another.

TRS-80 Software and Hardware from MISOSYS

PRO-WAM 2.0

M-51-025

This desktop manager gives keystroke access to 4 memory resident **pop-up** applications and disk access of others. A Function Key lets you invoke DOS library commands. PRO-WAM turns your TRS-80 into a powerful machine because it comes with many useful and powerful time savers and desk organizers. Here's some of what you get:

- ✓ An **ADDRESS** file, data base prints cards and mailing labels. Throw away that black book and your Rolodex file.
- ✓ **HEAD** pipes formatted address data into your letters.
- ✓ **BRINGUP** tickler file schedules up to 12 items per day by time. New print module. Remember those appointments.
- ✓ **CALendar** gives you a month at a glance; covers 4000 years. Flags days with BRINGUP items.
- ✓ A 3x5 **CARD** filer for a free-form scratch pad of 40 columns by 12 rows. Or use the new **CARDX** with **forms** capabilities. It's great for keeping a small data base.
- ✓ **PHRASE** is a KSM from disk for lots of automation.
- ✓ A telephone list and auto**DIALER** for Hayes modems.
- ✓ **CALCulator** gives you 4-functions at your fingertips. **RPNALC** gives 7-functions in bin, oct, dec, and hex.

PSORT puts your PRO-WAM data files in sort order. **EXPORT** and **IMPORT** functions allow you to move data across windows between applications and programs. There's even an online **HELP** facility!

PRO-WAM works with all programs which use standard DOS keyboard requests and honor the DOS high memory pointer; requires one 32K RAM bank, about 2K of high memory, and a small piece of low RAM. If you have a model 4, then you must have PRO-WAM!

Mister ED

M-51-028

Mister ED is loaded with **editor** applications. All are full screen which make your editing jobs easy. Best of all, these are all **PRO-WAM** applications so they can **pop up** even when you are using other programs and applications.

- ✓ **DED** edits disk sectors; **FED** edits file records; and **MED** edits memory pages (even alternate banks). All use a similar display screen and strikingly similar commands to enable you to edit anything. Get comfortable with one and you will know how to use all three of these editors.
- ✓ **VED** lets you edit the video screen with CARD-type editing. You get cut & paste; with this, you can easily use it as the **clipboard** facility found on more expensive systems.
- ✓ **TED** is just like the editor you get with LS-DOS 6.3; but ours works from PRO-WAM while you are using other programs! It's friendly, fast, and great for writing notes when you are right in the middle of a program you can't interrupt.

Little Brother-M4

L-50-510

LB is a flat file data management system where ease of use is its primary goal; you don't need to program anything or remember complicated command sequences to manage data. Even for the most complex data management needs, LB produces results quickly; EVERY function in LB is menu driven and comes with complete on-line **HELP** information.

To set up a data base, you just define the record layout. For each field, enter a descriptive name, type, and length. LB handles up to **65534 records**; each can contain up to **1024 characters**. LB supports up to **64 fields per record**; fields may be up to 254 characters long. There are seven types of data fields available: alpha, numeric, right justified, literal, dollar, float, and calculated (add, sub, mul, and div); any of which may be a *Protected Field*, so that its data will not be displayed unless the proper *Password* is entered.

You next establish a *screen*, and you are ready to begin entering data! You may view or edit any record at any time. Find information quickly. You can even create an *index* to your data so any record can be accessed within seconds.

Simply define a print format screen, and LB will print records according to your specifications; 10 different formats can be created. You can print with headers/footers, date, time, page numbering, totals and sub-totals if desired, mailing labels format, and even form letters. You select what records get printed and can use an index for printing in *sorted* order as well; great for organizing your report.

For **automating your processing**, LB can be run in an *automatic* mode; frequently used procedures (such as selecting, sorting and printing) can be saved for future use.

LB requires a minimum of two floppy disk drives and 128K of RAM or hard disk, 64K, and one floppy disk drive).

LBMU-M4

L-50-515

LBMU lets you generate a new data file set from existing LB data. This can save you countless hours in restructuring an existing data base, and provides you an excellent means to archive *old* records from your data base.

You can use all records in the existing file, or a chosen few by using an LB index file). The new data base file will be allocated with only as many records as needed. This is useful for de-allocating the space consumed by a data base file if too many records were allocated for it.

You may use any field and associated data which is present in the existing data base. You may incorporate additional fields. Furthermore, LBMU will allow you to lengthen or shorten any existing field. LBMU will even perform some field type conversions for you. For example, you can convert from numeric or right justified fields into dollar/float fields.

FIXDEL is included to rechain all deleted records in a data file should the deleted record chain become broken. If you are encountering failures in re-using your deleted records, then **FIXDEL** is the utility program for you.

EDAS

[DOS 6 M-21-082] [LDOS 5.x M-20-082]

This powerful combined disk-based **line editor** and **Z80 macro assembler** assembles from one or more nested source disk files or memory buffer; features nested conditionals with ten pseudo-ops, nested 7-level **MACROS** with parameters both positional and by keyword, cross reference listings; and a separate **full screen text editor**.

The expression evaluator supports left-to-right evaluation of add/sub/mul/div/mod/shift, logical AND/OR/XOR/NOT, binar ops EQ/GE/GT/LE/LT/SHL/SHR; unary HIGH/LOW. Labels may be up to 15 characters long; start with A-Z, "@", or "\$"; positions 2-15 may also use "*" and "_".

A sorted symbol table listing is available during the assembly. A complete **CROSS REFERENCE** listing is performed by the **XREF** utility.

Line edit text in memory and use a command syntax identical to BASIC; with block move/copy; with string change/search. Invoke DOS commands within the editor.

If you are writing system software, support software, applications - big or small, EDAS will provide the power to make your job easier, faster, and more worthwhile.

MRAS

[DOS 6.x M-21-083] [LDOS 5.x M20-083]

An advanced Z80 assembly package for the programmer who wants a powerful and flexible development system. It includes a macro assembler which generates either **relocatable object code** modules or CMD files directly, a linker, a librarian, a full-screen text editor, a utility for converting to/from line-numbered files, and a cross reference tool for directly generated CMD files.

MRAS generates M80 compatible **/REL** files. Macro support includes REPT, IRP, and IRPC as well as standard macro parameters by both **keyword** and **position**. It supports nested includes and a full range of nested conditionals. MRAS incorporates a fast binary-searched symbol table and the ability to enter symbol values from the command line. Labels can be any length with 15-character significance. It has flexible output redirection of listing and symbol table.

MLINK supports virtual memory bit-stream buffering, REL and IRL library searching, direct generation of complex program overlays, and does not generate disk space for DEFS regions in DSEGs and COMMONs. The linker can generate either a normal executable command file (CMD) or a core image file (CIM). **MLINK** supports the following special link items: 0-3, 5-7, 9-11, 13-15.

MLIB maintains both **relocatable (REL)** and **Indexed relocatable (IRL)** module libraries. You can add, delete, extract, or replace a module; and get module maps.

SAID is an advanced **full screen text editor**. It can be used to generate your assembler source code, C-language source code, or edit any type of ASCII file. Model 4 128K operation provides multiple editing buffers.

TRS-80 Software and Hardware from MISOSYS

CON80Z [DOS 6 M-31-033] [LDOS 5.x M-30-033]

A source translator to help you convert your Intel 8080 files to Zilog Z80 files. Converts CR-LF sequences to a single CR; By using the CR="c" parameter in the command line, the character "c" will be interpreted as a logical line end.

Translates "M" to "(HL)"; extended instructions (LDX); B, D, H, and PSW are changed to BC, DE, HL, and AF; changes <DB/DS/DW/SET> to <DEFB/DEFS/DEFW/DEFL>.

DSMBLR [DOS 6 M-31-053] [LDOS 5.x M-30-053]

This **disassembler** provides extensive capabilities such as direct disassembly from CMD disk files, automatic partitioning of output disk files, data screening for non-code regions, and full label generation. It even generates the ORGs and END statement - the complete ball of wax. You will find that the use of this disassembler - *even by a beginning assembly language programmer* - will be paying handsome rewards with the ease of its use and clarity of the documentation. It's a professional tool for your use.

The labeling disassembler produces an assembler source from in-memory code or directly from a CMD-type disk file. Labels are generated for 16-bit references; a reference is any relative instruction target address or a 16-bit target for load, call, jump, add, or subtract instructions.

The disassembler allows you to build a *screening data file* telling what segments of the program are to be interpreted as data regions. You enter the addresses of the "segments" after analyzing the target program's disassembly.

CRT output is in screen-sized pages. **PRINTER** output is paged with column headings, page numbers and titles for print-outs that look identical to an assembler listing. Output to **DISK** produces a file suitable for MRAS/EDAS (configurable for others), and is automatically segmented into manageable file sizes. You will even be prompted to change the output file diskette when the disk becomes full.

UNREL [T80 M-30-054] [CPM M-32-054]

Here's one of those rare utilities designed for the programmer. **UNREL** will decode a relocatable object module which has been assembled by either Microsoft's M80 or MISOSYS' MRAS assemblers. The output is an assembler source file compatible with MRAS and M80.

UNREL assumes anything in a code segment is code, and anything in a data segment is data. It supports special link items: 0-3, 5-7, 9-11, 13-15.

We bundle in **SPLITLIB** which can be used to split a library into separate modules. We also include **DECODEREL**, for displaying the *bit stream* of a REL file. This can be used to more fully understand the actual bit stream.

UNREL should be the perfect professional assembler's tool for your bag of tricks.

LS-Host/Term [DOS 6.x L-35-281]

This communications' package gives you the tools needed to get communications chores done quickly and effectively.

ADDS25 is set up to look like a Radio Shack DT-1 emulating an ADDS-25 terminal. Full cursor positioning, reverse video, and blinking fields are supported.

TERM6 allows one Model 4/4P to be used as a remote terminal to another running **HOST** portion of LS-Host/Term.

HOST lets your 4/4P operate remotely with *password* access for log-in from another 4/4P using **ADDS25**. All video effects are properly transferred to the remote system.

We include a version of **XMODEM** for file transfer between systems using the MODEM7 protocol, as well as a utility that converts to/from binary and HEX-ASCII binary representation, to/from INTEL Hex format and checksum files.

MC [DOS 6.x M-21-064] [LDOS 5.x M-20-064]

If you are looking for a **full C compiler**, look no further. If you are looking for a well stocked UNIX System V standard library, look no further. **MC**, reviewed in the January 1987 issue of *80 MICROCOMPUTING*, is a complete C compiler which adheres to the standards established by Kernighan and Ritchie. The library of functions is extensive and System V compatible. The compiler generates Z80 relocatable macro assembler code (M80 or our MRAS). The libraries are files of relocatable object modules. **MC** is a full-featured compiler for the discriminating programmer!

MC supports command line *I/O redirection* for compiled programs, *wild-card* file specifications, parsing for UNIX *"."* extensions in file specifications, *overlay* support (requires MRAS), a full pre-processor, lots of options, and is designed for the programmer wishing the ultimate in C compilers. The package is supplied with the compiler, pre-processor, an optimizer, assembler macro files, C libraries, a Job Control Language file, the header files, and a 400+ page user manual. **MC** requires the use of either M-80 or MRAS (available separately), 2 disk drives, and upper/lower case.

TBA [LDOS 5.x L-21-010] [DOS 6.x L-21-011]

The **BASIC Answer** is a text pre-processing utility that allows programmers to generate program code in a structured manner. *Source* code is created with your text editor; **TBA** is then used to process this source code into ordinary interpretive BASIC code that uses a minimum of memory.

TBA utilizes **labels** in lieu of line numbers; supports variable names to 14 significant characters; allows the use of pseudo **Global** and **Local** variables (local variables retain their value only in a unique subroutine); and introduces the concept of *Conditional Translation*. This last feature allows co-existence of "machine-dependent" or other variable code within the same program source with the irrelevant sections ignored when processing the source to executable code.

EnhComp [DOS 6 M-21-072] [LDOS 5 M-20-072]

This is an enhanced **BASIC compiler** released in 1986 and reviewed in the March 1987 issue of *80 Microcomputing* and October 1987 issue of *COMPUTER SHOPPER*. This compiler has lots of great features. It handles the bulk of Model III Microsoft BASIC and supports additional commands and functions. Standard is floating point with both **single and double precision** functions; random file access ("**X**" mode for recls to 32767), turtle graphics, pixel graphics, keyed array sort, multi-lined functions, user commands, **IF-THEN-ELSE**, **REPEAT-UNTIL**, printer control, sequential file positioning, line labels and more.

A *supervisor* program automates the edit-compile-test phases inherent when using compilers; this makes using EnhComp almost as easy to use as your BASIC interpreter. You also get **CED**, a **line editor** with string search/change, partial load/save, renumber, copy, and move.

Enhcomp has a built-in **Z80 assembler**. You can easily create hybrid programs of BASIC statements and in-line assembly code which **completely eliminate** contorted string packing and DATA statement high-memory module techniques for your BASIC program to access a machine code module. Z80-MODE accesses BASIC's variables!

You'll have to edit *existing* BASIC programs, but the power and completeness of EnhComp make that an easy task.

RATFOR-M4 #M-21-073

RATFOR reduces your programming time and effort dramatically over that required when FORTRAN is used, because **RATFOR** code is **fully structured**, facilitating modification and debugging, and because program flow is apparent from the overall appearance of the program; comments are simpler and more versatile than in FORTRAN, simplifying self-documentation. This allows changes without the subsequent debugging tolerated when modifying FORTRAN. **RATFOR** *compiles* source code to an *object* of FORTRAN; use your existing FORTRAN compiler to convert this to executable.

RATFOR is free-field; blanks are significant as delimiters; numerical statement labels are mostly unnecessary; all 80 columns are available for statements; provides user-defined macros; and **RATFOR** provides powerful loop constructs.

RATFOR is an excellent language for general purpose use, but it is vastly superior to FORTRAN when working with a large number of modules without documentation, as is necessary when producing very large programs.

Extensions supported include the "arith" macro to perform binary arithmetic operations, read and print macros for short form **READ** and **PRINT**, and support of any valid FORTRAN expression for "switch" and "case" operands.

This package includes the language translator, a *batch* file to automate compilation, a language Reference Manual, an Installation Manual, application programs in source code on disk, and our **LED** text editor for source code preparation.

TRS-80 Software and Hardware from MISOSYS

BSORT [DOS 6.1.2+ L-32-210] [LDOS 5.x L-32-200]

Here's a high speed **sort** for almost any number of one or two-dimensional BASIC arrays: *string*, *integer*, *single* and *double precision*. When invoked from your BASIC program, BSORT will perform the indicated sort, and execution will continue with the next statement in your program.

Multiple *key arrays* may be specified; the sorting on each key can be done in either *ascending* or *descending* order. **Tag arrays** that do not affect the sort, but merely follow along may also be specified. BSORT can also create an integer *index* array, without affecting the actual order of the elements in the "sorted" array. For string arrays, "midstring" parameters allow sorting based on a portion or "midstring" of the key array elements. BSORT goes far beyond CMD"O" in capabilities and performance.

LED [LDOS 5.x L-30-020] [DOS 6.x L-30-021]

A full screen **text editor** for almost any type of ASCII file, including ASCII program source code for BASIC programs, TBA source, as well as JCL and KSM files. The command menu may be displayed while editing text. This display includes all command keys, the filename, the cursor column, the character hex value, and the available memory.

Cursor positioning uses the **arrow** keys. <CLEAR> key combinations move the cursor to the top, bottom, left or right. Has the following modes: *overtyp*, *insert*, *insert line*, and *delete*. Block mode allows the manipulation of large text areas. Search and Search/Replace are also provided.

Hex mode allows characters to be input as two hexadecimal digits; makes possible the direct editing of graphics.

THE SOURCE, 3-Volume Set L-60-020

This will be the last time that these books will be made available for a *giveaway* price. **THE SOURCE** contains a vast wealth of information for the assembly language programmer. **THE SOURCE** is not only informative, but also an excellent learning tool.

These books contain the complete, **commented assembler** source code for TRSDOS 6.2, excluding hard disk support, the Microsoft BASIC and the HELP utility. Each book is softbound, 8-1/2 by 11. The complete set totals over eleven hundred pages of cleanly commented, elegant source code. Volume 1, The System, covers SYS0 to SYS5 and SYS9 to SYS13. Volume 2, The Libraries, covers all of the library commands making up SYS6, SYS7 and SYS8. Volume 3, The Utilities, covers all utilities, drivers, and filters.

DSM [DOS 6.x L-35-205] [LDOS 5.x L-35-204]

A high speed, **disk virtual sorting utility** that eliminates the burden of sorting from your applications software development project. DSM will create and maintain index files for you. Since the sort is disk virtual, your only limitation is the amount of available disk space, not available memory!

Sorts almost any type of field in a random access file: *integer*, *single* and *double precision*, and *strings*. Files can have 65,535 records with an LRL up to 1024. Specify up to 24 select fields (12 for DSM51). Relations (EQ, LT, etc) may be applied to your criteria; operators AND/OR may be used.

Sort *ascending* or *descending*; skip records that match a *deleted record* value. Save a *template* of the specifications to disk to automate the sort. This allows you to set up a sort operation that is transparent to even a novice user.

DSM is intended for use with user-developed applications software. Please note that DSM creates an index file, as opposed to actually re-ordering the records in the data file.

The Gobbling Box M-55-020

This fast-paced action **arcade-type game** runs on the TRS-80 Model I, III, and 4/4P/4D. The game generates a variety of special sound effects and music which complement the action on the screen. The arrow keys or Alpha Products joystick control the movements of the GOBBLER in this game.

You want your GOBBLER to eat as many dots as possible, while trying to avoid the ZONKERS who won't stop chasing your GOBBLER until one of them eats it or until the GOBBLER eats all dots on the GameBox. The GOBBLER's reward is a new Box; there's 3 in all. The GOBBLER can tame the ZONKERS for a short while by eating one of the ENERGIZERS on the board. Then it's the GOBBLER's turn to chase, catch and eat the ZONKERS.

The game has two skill levels; the pace is fast; the sound is great; the action is continuous. You can't beat this bargain of a game. Even Stacey plays it!

RSHARD M-12-013

Finally for your Radio Shack hard disk drive is this hard disk driver package from MISOSYS - at a reasonable price. You get support for both LDOS 5.3 and LS-DOS 6.3

❶ **RSHARDx** driver partitions by both head and/or cylinder; supports two 8-headed drives up to 1024 cylinders.

❷ **RSFORMx** formatter adds both low level and high level formatting to your drive's partitions.

❸ **HDCHECK** checks the performance of your drive.

❹ **ARCHIVEx** lets you backup some or all of the files on your hard drive to multiple floppies; BIG files and small files.

❺ **RESTOREx** lets you selectively restore some or all archived files to your hard drive.

All ten modules come fully documented and are ready to install into your LDOS 5.3 or LS-DOS 6.3 system (or both).

QuizMaster [LDOS 5.x L-51-500]

QM is an educational question and answer program that can also be used as a game. It displays a question and four possible answers and scores the operator's response based upon speed and accuracy. **QM** comes with five subject files of up to 100 questions each derived from grades 6-9 textbooks: U.S. Information; Geography; Math; General trivia; as well as Fantasy and Science Fiction trivia.

QM **randomizes** both the order of the questions and the order of the answers to prevent memorization. The question sequence is never the same. Extended play provides a *sudden death mode* feature for the skillful user.

QM includes all the programs necessary to establish and maintain your own series of *multiple choice questions* on any subject. Five support programs are provided to create, extend, edit, print, and maintain the question & answer files. All features are easy to use and easy to operate.

Lair of the Dragon [Mod 3&4 M-55-021]

If you thought the TRS-80 was dead, think again. Our **Lair of the Dragon MegAdventure** is unlike virtually any other interactive fiction adventure that you have ever played, for it will more than just paint its pictures upon the canvas of your imagination - it will slap the sweat right onto your forehead!

If you truly believe that discovery is one of the finest points in life, if you would like to test your ability to think logically to the fullest extent of your ability, if you would like to take on the largest adventure ever written in the genre of interactive fiction, and if you have the guts to face that which would make any other mortal elf cringe in fear, then **Lair of the Dragon** is your cup of poison; for reward is a hard-earned commodity here, not given easily to the timid and the faint-hearted. If you are an old hand at adventuring, then be prepared for a worthy opponent.

MegAdventure rips the door to adventure right off its hinges!

diskDISK [LDOS 5.x L-35-211] [DOS 6.x L-35-212]

Do you have a hard disk? If so, you need **diskDISK**. The diskDISK utility allows the creation of *logical disk partitions* as files on a physical disk drive. This is indispensable for hard disk users. Once a **diskDISK** file is *installed* into a logical drive slot, the diskDISK can be used just like any other physical drive; **diskDISK** provides for easy swapping of any currently active diskDISK file.

With **diskDISK**, you can easily group related files for ease of maintenance. DiskDISK files can also be set up as *images* of physical drives to allow mirror image backups.

Finally, diskDISK drives allocate in granule sizes smaller than your hard disk system. Five inch diskDISK images allocate just like floppy drives. Also, there are special diskDISK types that allocate in one or two sector granules for maximum storage efficiency.

TRS-80 Software and Hardware from MISOSYS

LDOS 5.3 [Mod 3/4 M-10-033] [MAX80 M-10-833]

Provides *portability* between models and systems. LDOS 5.3 for the Model 3 and Model 4 LS-DOS 6.3 all use the same disk format, providing data diskette compatibility. If you use LS-DOS 6.3, you should use LDOS 5.3 on your Model 4 for Model 3 mode software.

Over the old 5.1.4 release, LDOS 5.3 adds:

- ✓ Date support through 12/31/99, time stamping for files
- ✓ DATECONV converts older disks to extended dating
- ✓ On-line **HELP** facility for DOS and BASIC - 117 screens
- ✓ **FORMS** lets you change printer filter parameters
- ✓ **SETCOM** lets you change RS-232 parameters
- ✓ paged displays in LIST; full-screen hex mode
- ✓ **MEMORY** displays data on high-memory modules.
- ✓ Access to **LIB** commands from **LCOMM**
- ✓ **TED**, a full screen text editor for ASCII files.
- ✓ **PATCH** supports D&F patch lines and REMOVE fix
- ✓ line **COPY** and line **MOVE** in BASIC.
- ✓ a powerful **INPUT@** for screen fielded input.
- ✓ **CMD"V"** dumps an active variable list.

LDOS 5.3 is available only as an upgrade kit to 5.1.4. New users should also purchase the LDOS 5.1.4 User Manual

LDOS User Manual

L-40-020

LDOS 5.1.4 is documented in an extensive operating manual (over 400 pages) containing both user instructions and a large technical information section. Numerous examples are given for all operating functions.

Hardware Interface Kit

M-12-110

This will allow you access to your Model 4 *hardware features* while using LDOS 5.3. Here's what you get:

- ✓ **K14** keyboard driver: uses <CTRL> key for control; <CAPS> key for caps lock; and the three function keys generate values for both unshifted and shifted activations.
- ✓ **SET2RAM** switches to Model III RAM mode. By eliminating the cassette routines, it adds memory management facilities. The @BANK handler provides bank switching capability; @EXMEM extended memory handler allows for easy programming of I/O from/to memory banks.
- ✓ **MemDISK** is a RAM disk which provides a one or two bank memory drive - the same as TRSDOS 6. With it you can create another "disk" drive of up to 63K.
- ✓ **BANKER** is a utility to manage bank utilization.

All four modules come fully documented and are ready to install into your LDOS 5.3 system using a Model 4 computer. A 128K machine is only required for MemDISK/DCT and the memory management facility.

Utility Disk #1

L-32-070

14 utilities useful to novice and experienced LDOS users.

- ✓ **COMP** is a file and/or byte-for-byte comparison utility.
- ✓ **DCT** allows you to view or modify the Drive Code Table.
- ✓ **DIRCHECK** checks the directory on a diskette and corrects most recoverable directory errors.
- ✓ **MAP** displays or prints the allocation (granules or cylinders and sectors) of a file on a diskette.
- ✓ **RAMTEST** is a self-relocating RAM memory test.
- ✓ **READ40** allows access to a 40T disk in an 80T drive.
- ✓ **TYPEIN** combines the functions of JCL and KSM. Allows programs such as Profile 3+HD to be totally automated.
- ✓ **UNKILL** recovers files accidentally **KILLED** or **PURGED**.

LS-Utility Disk

L-32-150

Filters and Utilities for DOS 6.x:

- ✓ **PRCODES** gives control of **boldface** and **underlining**
- ✓ **TRAP** discards any user-defined character.
- ✓ **MAXLATE** is a translation filter system for I/O devices. Does 1:1 or 1:many; includes EBCDIC and DVORAK tables.
- ✓ **KSMPLUS** improves on the DOS; allows key re-definition *on the fly*; defines strings for the function keys.
- ✓ **READ40** allows access to a 40T disk in an 80T drive.
- ✓ **TYPEIN** combines the functions of JCL and KSM. Allows programs such as Profile 4 to be totally automated.

FILTERS

[LDOS 5.x L-32-053]

This combines 23 filters and utilities from FILTER Disks 1 and 2 with assembly source code at a clearance price.

- ✓ **XLATE** translation for I/O devices
- ✓ **LISTBAS** print formatting for BASIC programs
- ✓ **STRIP7** removes high-order bit off all characters
- ✓ **STRIPCNT** replaces output >127 or <32 with a # symbol
- ✓ **MONITOR** displays control chars in string form (%xx)
- ✓ **TITLE** prints a title after form feed
- ✓ **UPPER** converts lower-case character to upper case
- ✓ **LOWER** converts upper case character to lower case
- ✓ **SLASH0** translates zero to zero-backspace-slash
- ✓ **TRAP** discards any user-defined character
- ✓ **LINEFEED** adds or removes a linefeed after return
- ✓ **PAGEPAWS** pauses after formfeed for <ENTER> key
- ✓ **CALC** performs hex/dec/bin conversion; hex add or sub
- ✓ **REMOVE** removes occurrences of a byte from a disk file
- ✓ **COMM1** tests for modem carrier
- ✓ **DICTATE** toggles cassette on/off from the ✓ keyboard
- ✓ **DOSPEED** regulates output device speed from keyboard
- ✓ **KSMPLUS** features key re-definition *on the fly*
- ✓ **LCOUNT** adds a line number before each line of output
- ✓ **MARGIN** sends a 2-char control before margin spaces
- ✓ **MAXLATE** translates one character to a group of chars
- ✓ **SLOSTEP** for drives that require additional settling time
- ✓ **VIDSAV** saves the current video screen in high memory

XLR8er

R-MB-004

We're convinced that H.I.Tech's speedup/memory board is a **necessary** enhancement of your Model 4. See how it can improve your operation by reading our article on **SPEED** in *THE MISOSYS QUARTERLY* issue 2.2.

- ✓ **Improved speed:** 64180CPU up to 8MHz Z80 equivalent
- ✓ **Expanded RAM:** 256K additional (8 more banks)

When ordering, you must specify your exact machine configuration (4/4p/4d, hires graphics).

Printer Switch Boxes

For 2 computers and 1 printer; or 1 computer and 2 printers; or 2 computers and 2 printers; how have you lived without a printer switchbox? Aren't you tired of unplugging cables? These boxes switch all 36 leads of Centronics connectors.

- R-SB-PAB**, AB 2-position switch box
- R-SB-PAD**, ABCD 4-position switch box
- R-SB-PX2**, AaBb cross switch box

R-06-CMM, 6-foot male-male cable for box to printer.

ED/ASM-86™

- 80X86 Assembly Language development

An integrated editor, assembler, linker, and debugger for 8086, 80186, 80286, and 8087 assembly and disassembly. All features are in a single EXE file.

- a full-featured line EDITOR with intra-line editing, block move and copy, partial save and load.
- a full-screen turbo-type editor is supported on CGA-equipped systems.
- the ASSEMBLER supports structured coding; can directly generate a COM or EXE file; assembly to memory for faster debugging.
- The DEBUGGER includes symbolic disassembly of arbitrary code to disk.

ED/ASM-86 [M-86-030] . . . ~~\$124.95~~ + \$5 S&H

Now only \$99.95

RATFOR-86™

- Rational FORTRAN translator

A professional implementation of RAtional FORtran by James Beard, Ph.D. Provides structure and greater portability to FORTRAN programs to reduce your programming time and effort dramatically over that required when writing directly in FORTRAN. Includes tutorial reference manual.

- compiler has extensive macro support
- "arith" macro for binary arithmetic
- short form READ and PRINT
- enhanced switch case support
- Requires a FORTRAN compiler

RATFOR-86 [M-86-73] . . . \$99.95 + \$5 S&H

VA residents add 4 1/2% sales tax.
S&H: Canada add \$1;
Foreign use S&H times 3

LB86™

- A useful and flexible data manager

Easily used by anyone for managing their data. It's menu driven for ease of use; absolutely no programming needed. Why settle for expensive over-kill with data managers you have to program when economically priced LB86 will do mailing labels, customer lists, registration data.

- Store up to 65,534 records per data base
- Up to 1,024 characters per record
- Up to 64 fields per record
- Up to 254 characters per field
- Nine field types for flexibility
- Select and sort on up to 8 fields
- Keep 5 different indexes for data access
- 10 input/update screens per data base
- 10 printout formats per data base
- Extensive on-line help always available

LB86 [L-86-510] . . . \$74.95 + \$5 S&H

DED86™

- A utility disk that won't leave you puzzled.

A powerful sector-oriented disk/file editor and a page oriented memory editor. Search your entire disk while you tag sectors or clusters to be "kept"; direct DED86 to write the sectors as a disk file. Great for file recovery without fussing over FATs. DED86 gives you important features:

- Position by cylinder/head/sector
- Position by logical sector or cluster
- Jump about subdirectories
- Keep sectors/clusters/memory
- Edit bytes in hexadecimal or ASCII
- Search strings in ASCII or hexadecimal
- DOS subshell available for your use

DED86 [M-86-020] . . \$59.95 + \$5 S&H
