Tandy® WP-2 Portable Wordprocessor

Catalog Number: 26-3930

SPECIFICATIONS

Microprocessor	NEC 70008A-6(Z80 type)		
Clock Speed	5.5296 MHz		
Memory	256 KByte Standard ROM (BIOS, WORDPROCESSOR, and spell check), 32 KByte Standard RAM (VRAM and Free Area) ROM: Option (IC Card) Expandable up to 256 Kbyte RAM: Option (RAM chip) Expandable 32 Kbyte or 128 Kbyte (RAM Disk) Option (IC Card) Expandable 32 Kbyte, 64 Kbyte, 128 Kbyte (IC Card)		
Keyboard	Full-size 62 keys.		
Display	"Supertwist" LCD, 480 × 64 pixels, 8 × 80 characters		
External Connections	AC Adapter DB-25 Parallel Printer DB-9 Serial Port DIN-8 Cassette Tape IC Card-38 Memory Card		
Battery	AA size battery × 4, Alkaline or Ni-Cd		
AC Adapter	6 VDC 400 mA, UL listed (Cat. No. 26-3804)		
Power Consumption (at 6VDC)	UNIT	NORMAL	LIMIT
	mA	80 – 90	140

I. SYSTEM OVERVIEW

This manual has been prepared for Tandy technicians working in the field or in repair centers. Users of this manual should be acquainted with the μ PD70008A-6 microprocessor and the 82C51 UART.

The Tandy WP-2 has the following applications programs in the standard ROM: TEXT, TELCOM, PHONE(ADDRESS), CALENDAR(SCHEDULE), SPELLCHECK, and FILES.

I-1. External View

1. **Keyboard:** Can be used like a standard typewriter. However, the Tandy WP-2 does have a few special keys. (See Appendix C of this manual for more details.)
2. **LCD Screen:** The Tandy WP-2 display is eight lines by 80 characters.
3. **Power Switch:** Pressing this switch turns the power on and off. To conserve the batteries, the Tandy WP-2 automatically turns the power off if you do not use it for 10 minutes in the default setting.
4. **CONTRAST control:** This control adjusts the contrast of the LCD display.
5. **PROTECT Switch:** This switch is used to prevent discharge of the Lithium battery, used for RAM back up. The Tandy WP-2 operates only when the power switch is set to ON. Set this switch to the OFF position when the Tandy WP-2 will not be used for a long period of time. Note that the RAM is not backed up when this switch is set to the OFF position, and all information RAM in will be lost.

Figure 1-1. Front View

1. **Expansion Card (IC Memory) Slot:** Insert the IC memory card into this slot. The connector in the slot is connected to the system bus of the CPU.
2. **Serial Interface Connector (RS232C):** Attach a DB-9 cable (such as Radio Shack Catalog Number 26-265) to this connector when you need to receive or transmit serial information. This connector is also used for the FDD.
3. **Printer Interface Connector:** For hard-copy printouts of information, attach any Radio Shack parallel printer to this connector, using an optional/extra printer cable.
4. **Cassette Interface Connector:** To save or load information on a cassette tape, connect the cassette recorder here. An optional/extra cassette recorder cable is required.
5. **AC Adapter Jack:** Connect the appropriate end of Radio Shack's AC adapter (Catalog Number 26-3804, optional/extra) to this connector. Connect the other end of the AC adapter to a standard AC wall-outlet or approved power strip.

Figure 1-2. Rear View

1. Main Battery Compartment: When an AC adapter is not connected, the Tandy WP-2 gets its power from four AA size batteries installed in this compartment.
2. Back-up Battery Compartment: The Tandy WP-2 gets RAM back-up power from a Lithium battery (CR-2430) installed in this compartment.
3. RESET Button Hole: If the Tandy WP-2 locks up (i.e., the display "freezes" and all keys seem to be inoperative), push this button; the display returns to the Main menu (start-up). All data stored in RAM will be lost when you press RESET. It is not likely that the Tandy WP-2 will lock up when you are using the built-in applications programs. However, it might occur with customized programs.
4. Stands: Pull down to make the WP-2 sit at an angle.

Figure 1-3. Bottom View

I-2. Internal View

Optional RAM Compartment: An optional RAM can be inserted into this compartment to enhance the Tandy WP-2 capabilities.

The Tandy WP-2 consists of four printed circuit boards:

- * LCD PCB
- * Keyboard PCB
- * Main PCB
- * Sub PCB

Figure 1-4. Main PCB (Bottom View and Top View)

Figure 1-5. LCD PCB

I-3. Specifications

Main Components

Keyboard	
Life of keyboard	500 million keystrokes
Number of keys	62 keys (8 × 8 key matrix)
All keys	Keys can be pressed down a distance of 3 millimeters.
Power switch	Press the switch down 1 millimeter to turn the WP-2 on or off.
LCD display	
Display panel	480 × 64 full-dot matrix
Dot pitch	0.44 × 0.44 mm
Dot size	0.41 × 0.41 mm
Effective display area	211.16 (W) × 28.12 (D) mm
Operation batteries	
Batteries	Type AA × 4 Alkaline-manganese batteries
Operation time (approximately)	3.5 days (typ.)-4 hours per day 14 days (typ.)-1 hour per day (Note: Without I/O units at normal temperature)
Memory protection battery	
Battery	Lithium battery (270 mAh/3.6V)
Back-up time	More than 3 years 32 KByte RAM 1.5 years (typical) 32 KByte + 32 KByte RAM option 1.5 years (typical) 32 KByte + 128 KByte RAM option
LSIs	
CPU	μPD70008A-6 Code compatible with Z80
ROM	Maximum 256 KByte + 256 KByte (Memory card) Standard 256 KByte
RAM	Maximum 32 KByte + 256 KByte (Memory card + Optional) Standard 32 KByte Optional 128 KByte
Power consumption	80 mA (typ. at 6VDC)
Dimensions	1" (H) × 11-2/3" (W) × 8-2/7" (D) 25.4 (H) × 297 (W) × 210 (D) mm
Weight	2.42 lbs.(1.1kg) with batteries

I/O Interface

RS-232C

Conforms to EIA standard signal	TXD (Transmit Data) RXD (Receive Data) RTS (Request to Send) CTS (Clear to Send) DSR (Data Set Ready) DTR (Data Terminal Ready) CD (Carrier Detect)
---------------------------------	---

Communications protocol

Word length	5, 6, 7, or 8 bit
Parity	NONE, EVEN or ODD
Stop bit length	1, 1.5, or 2 bit
Baud rate	75, 110, 150, 300, 600, 1200, 2400, 4800, or 9600 bps (19200 bps: when used for the FDD)
XON/XOFF	Enable/Disable
CR/LF	CR/LF/CR + LF
XMODEM	ASCII/CRC-XMODEM

Maximum transmission distance	16.5 feet (5 meters)
Maximum driver output voltage	+5 volts and -8 volts
Maximum receiver input voltage	± 15 volts
Minimum receiver input voltage	± 3 volts

Printer interface

Conforms to Centronics interface standards

Handshake signals	/STROBE, BUSY, /BUSY
-------------------	----------------------

Audio cassette interface

Data transfer rate	1500 BPS (Mark 2400 Hz, Space 1200 Hz)
Input level	0.8 to 5 volts (peak-to-peak)
Output level	600 mV (peak-to-peak)

Expansion card interface

RAM card	32 KByte, 64 KByte, or 128 KByte
ROM card	Less than or equal to 256 KByte

II. DISASSEMBLY INSTRUCTIONS

II-1. Top Case

1. Remove 4 hexagon screws from the CN3/CN6 DSUB Connector.

Figure 2-1. DSUB Connector Screw Removal

2. Remove the Main Batteries.

Figure 2-2. Removal of Main Batteries

3. Remove 5 screws "A" from the lower case.
4. Remove the upper case.
The upper and lower cases are secured by snaps. Pull up the front of the upper case first, as shown below.
Do not apply too much force when pulling it.

Figure 2-3. Top Case Removal

5. Disconnect the LCD flat cable from the connector on the main PCB.

Figure 2-4. LCD Cable Removal

II-2. Keyboard

1. Remove 2 screws "B" securing the keyboard to the bottom case.
2. Disconnect the keyboard flat cable from the connector on the main PCB.
3. Remove the keyboard.

Figure 2-5. Keyboard Removal

II-3. LCD

1. Remove 4 screws "C" securing the LCD PCB to the upper case.
2. Remove the LCD PCB.

Figure 2-6. LCD Removal

II-4. Main PCB

1. Disconnect the flat battery cable from the connector on the main PCB.
2. Remove the five electric wires for the cassette connector using a soldering iron.

Wire assignment

- | | |
|---|--------|
| 1 | Brown |
| 2 | Red |
| 3 | Orange |
| 4 | Yellow |
| 5 | Green |

3. Remove 1 screw "D" securing the main PCB to the bottom case.

4. Remove the main PCB.

Figure 2-7. Main PCB Removal

5. Remove the insulator sheet.
6. Remove the shield board.

II-5. Sub PCB

1. Remove the back-up battery cover and the Lithium battery.

Figure 2-8. Back-up Battery Cover and Back-up Battery Removal

2. Remove the spring for the negative battery terminal.
3. Remove the main positive battery terminal.
4. Remove the buzzer.
5. Remove the sub PCB.

Figure 2-9. Lower Case View

III. MAINTENANCE

III-1. Clean the Case and LCD Display

1. To avoid operational trouble, always keep the Tandy WP-2 clean.
2. Clean the case and the LCD screen using a soft, dry, lint-free cloth.
3. For tough stains, clean the case or the LCD screen with "Freon" 113.

Caution: Do not use any solvents other than "Freon" 113.

Note: To retain the contents of RAM, turn on the protect switch. If you turn off the protect switch, the WP-2 will not turn on, even if you push the power switch.

IV. THEORY OF OPERATION

IV-1. Hardware Specifications

CPU	NEC μ PD70008A-6
CPU CLOCK	5.5296 MHz
RAM	288 Kbyte (Maximum, internal + IC card) 32 Kbyte (Standard) internal 32 Kbyte (Optional internal RAM) 128 Kbyte (Optional internal RAM) IC card 32 Kbyte (Optional IC Card) 64 Kbyte (Optional IC Card) 128 Kbyte (Optional IC Card)
ROM	512 Kbyte (Maximum) 256 Kbyte (Standard) 32 Kbyte (Optional IC Card) 64 Kbyte (Optional IC Card) 128 Kbyte (Optional IC Card) 256 Kbyte (Optional IC Card)
DISPLAY	
Control Device	MSM6255 LCD Controller
Graphic Resolution	480 \times 64 dots
Character Display	80 characters \times 8 lines
Display Device	Super twist nematic LCD panel
Video RAM	3840 bits
Effective Display Area	211.17 \times 28.13 mm Dot size 0.41mm \times 0.41 mm Dot pitch 0.44mm \times 0.44 mm Aspect 1 : 1
KEYBOARD	
Number of Keys	62 keys (8 \times 8 key matrix)
RS232C INTERFACE	
Standard	Conforms to EIA Standard
Device	μ PD71051GU DS14C88 and DS14C89AN or SN75C188 and SN75C189AD
Word Length	5, 6, 7, or 8 bits
Parity	Even, Odd, or None
Stop Bit Length	1, 1.5, or 2 bits
Baud Rate	75, 110, 150, 300, 600, 1200, 2400, 4800, 9600, (19200 when used for the FDD)
Output Signal Level	Output signal base on +5V and -8V
Input Signal	Voltage SPACE = +3V to +15V MARK = -3V to -15V
PRINTER INTERFACE	
Control	The printer is controlled by the STROBE and BUSY signals.
Output	When a printer is used, the connector can be plugged in or removed without destroying the inner circuits of the device regardless of power ON/OFF. In addition, the interface circuits can effectively withstand static discharge breakdown.

AUDIO CASSETTE INTERFACE

Data Rate	1500 BPS (Mark=2400 Hz, Space=1200 Hz)
Input Level	0.8 to 5 volt (peak-to-peak)
Output Level	600 mV (peak-to-peak)

MEMORY CARD INTERFACE

Using Model	TOSHIBA MEMORY CARD
-------------	---------------------

POWER SOURCE	Output(DC): +5V 160mA, -8V 12mA, -15V 10mA
--------------	---

Main Battery	6V, four AA size Alkaline batteries or 4.8V, 450mAh, four AA size Nickel-Cadmium batteries
--------------	--

Back-up Battery	3V, 270 mAh flat Lithium battery This battery is used to hold the data of the main RAM and the expanded internal RAM.
-----------------	--

Battery Voltage Warning	The warning is indicated by "LOW BATTERY" on the screen and one beep. The user is instructed to change the batteries when the voltage goes below 4.0 V(Alkaline) or 4.7 V(Ni-Cd).
-------------------------	--

Back-up Warning	After the warning, the system can be used for about 10-30 minutes. The warning is indicated by "LOW BACKUP" on the screen and one beep. Then, the screen turns on and off. The user is instructed to change the battery when the voltage goes below 2.3 V. Before changing a back-up battery, save all RAM (standard and internal expansion) data to another device(s), or the system loses all RAM data.
-----------------	--

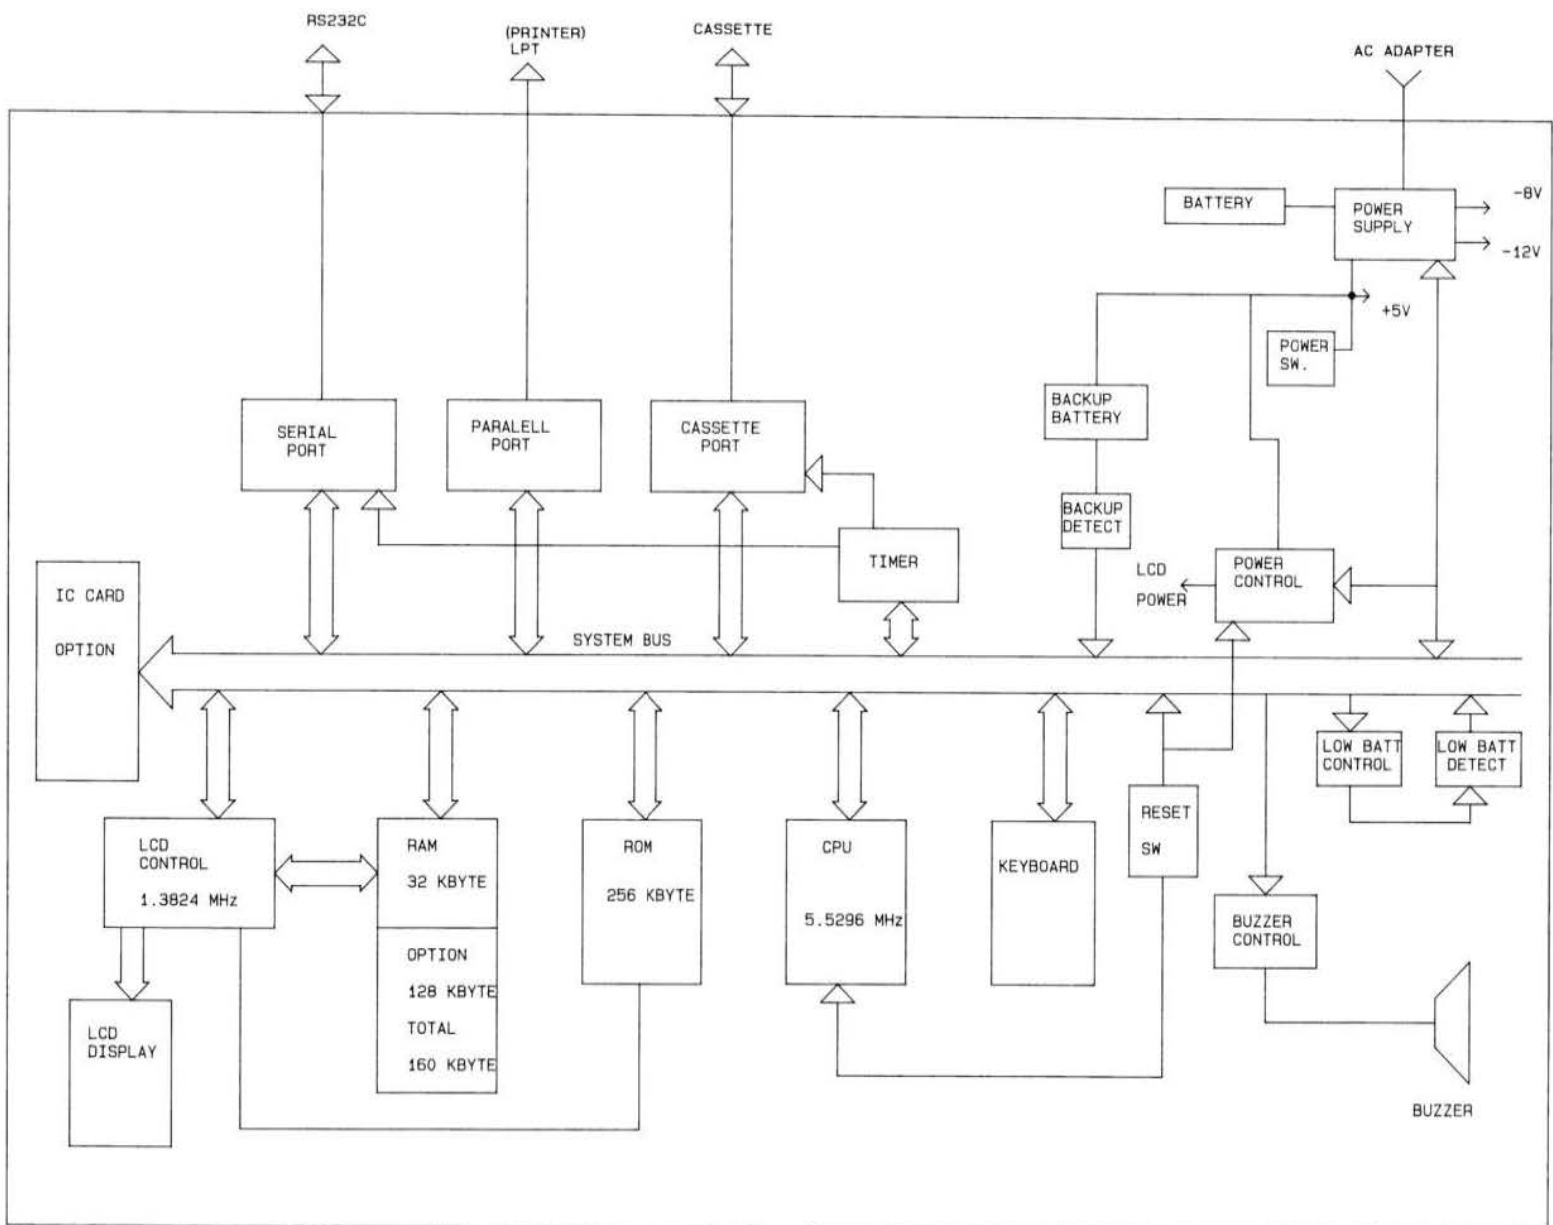

Figure 4-1

IV-4. Memory Map

The Memory Map is shown in Figure 4-2. Expansion RAM is mapped on the I/O address.

ROM: Expandable 16 KByte each

RAM: Expandable 32 KByte each

Figure 4-2

IV-5. Main RAM Control Circuit

Figure 4-3 shows the LCDC DIEN and the CPU $\overline{\text{WAIT}}$ control diagram. The Tandy WP-2 uses VRAM and MAIN RAM in common on a piece of RAM. To do this, the Tandy WP-2 uses synchronous accessing by the DIEN signal. The Tandy WP-2 avoids collision of CPU accessing and LCD refresh by waiting for CPU. Both the DIEN signal and WAIT signal are generated in IC5.

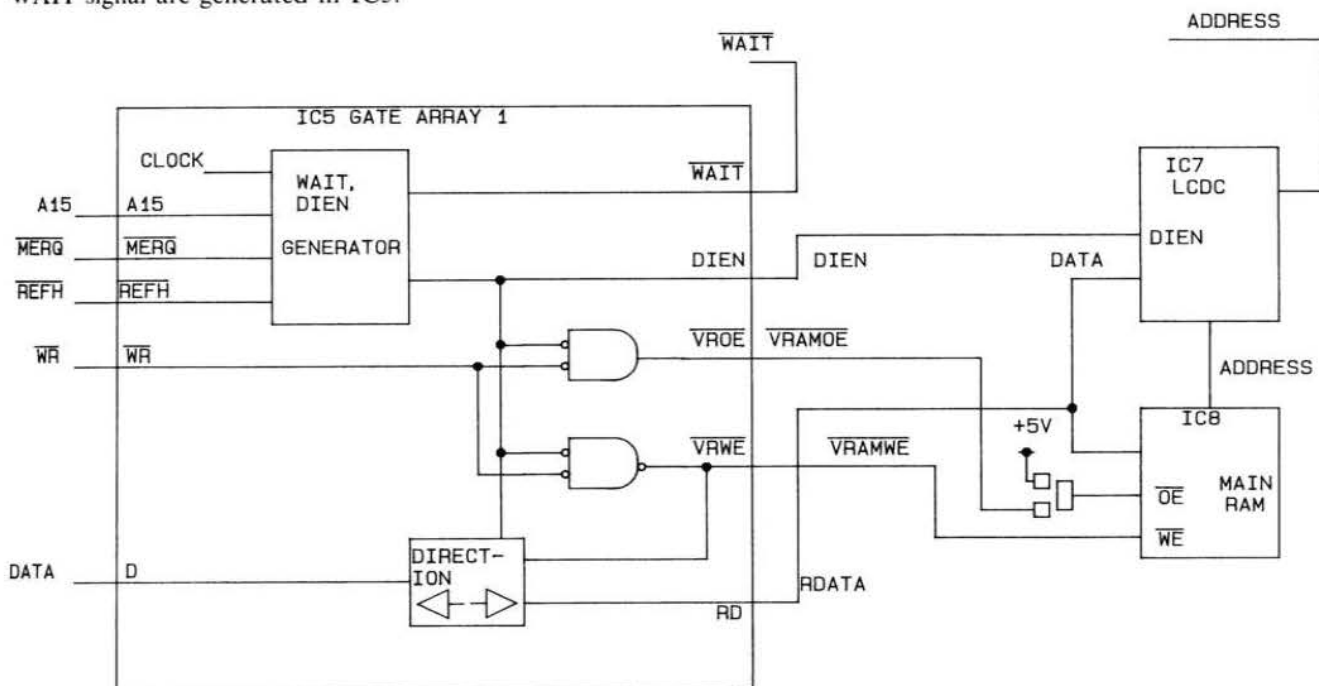

Figure 4-3

IV-6. Expansion RAM Control Circuit

Figure 4-4 shows the selecting bank diagram for the expansion RAM.

Bank 0-3 is used by the internal expansion RAM, and bank 4-7 is used by the IC card RAM.

Figure 4-4 shows the expansion RAM read/write diagram.

Both the selecting bank signal and read/write signal are generated in IC5. RAM bank control I/O is in bits 5-7 of 51H.

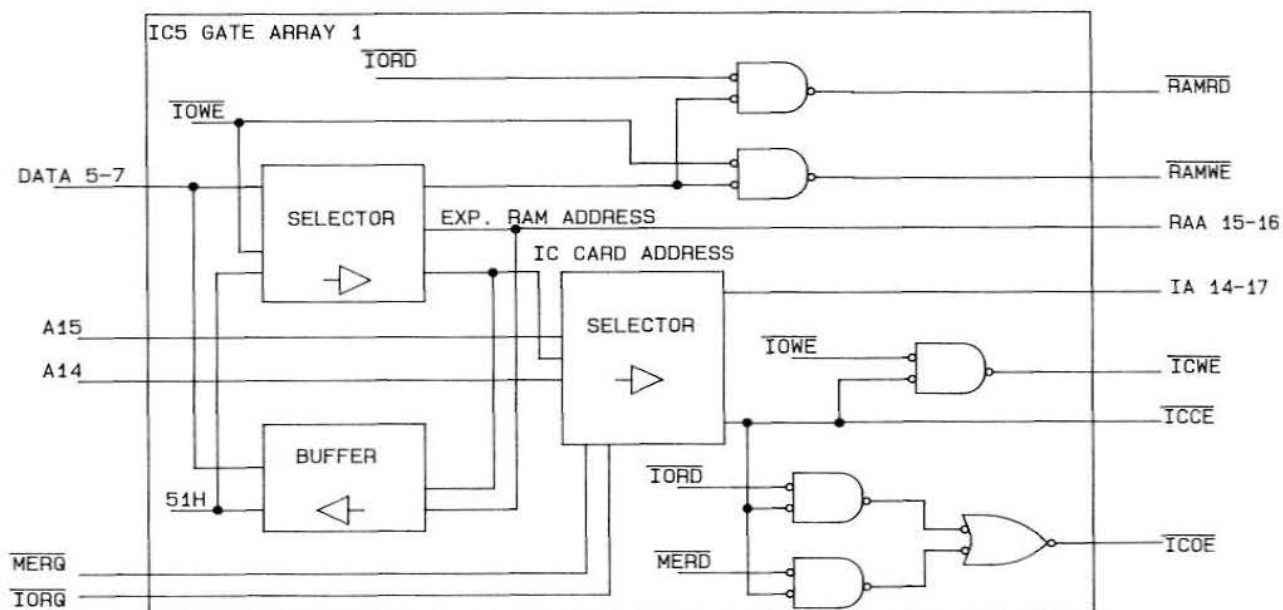

Figure 4-4

IV-7. ROM Control Circuit

Figure 4-5 shows the selecting bank diagram for the ROM. Accessing address 0-3FFF is not used in the selecting bank circuit. Bank 0-14 is used by the standard ROM, and bank 15-30 is used by the IC card ROM.

ROM bank control I/O is in bits 0-4 of 51H.

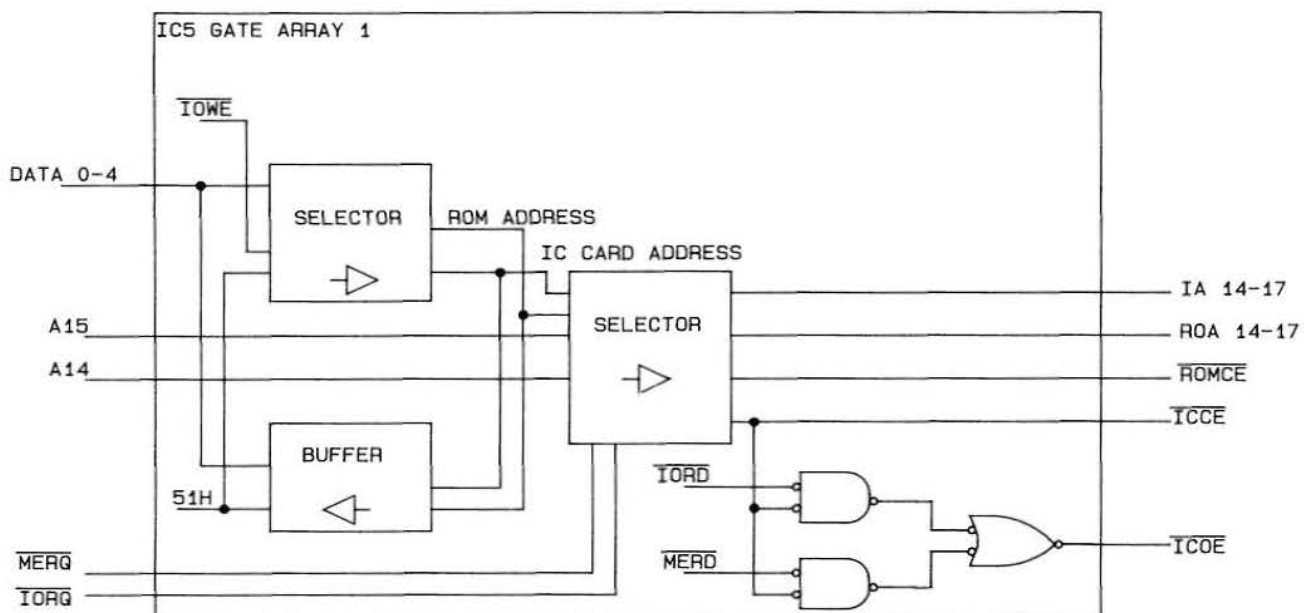

Figure 4-5

IV-8. I/O Address Map

ADDRESS		BIT CONTENTS	CONTROL
00H		Key scan data	Read/Write
UART CONTROLLER			
10H		82C51 character data	Read/Write
11H		82C51 control/status data	Read/Write
TIMER			
20H		Timer counter 0	Write only
21H		Timer counter 1	Write only
22H		Timer counter 2	Write only
23H		Timer control word	Write only
PRINTER			
30H		Printer data out port	Write only
31H	bit7	Printer strobe out port	Write only
32H	bit0	Printer Busy read port	Read only
32H	bit7	Printer /Busy read port	Read only
INTERRUPT/NMI CONTROL			
(setting interrupt mask control)

ADDRESS	BIT CONTENTS	CONTROL
6255 (LCDC) CONTROL		
60H	Read/Write port	
61H	Instruction register port	

IV-9. Interrupt

The μ PD70008A-6 has abundant interrupt processing functions:

External interrupt: NMI (Non-maskable interrupt)

INT (Maskable interrupt)

Interrupt by software

Interrupt control list: Timer counter

Serial RXRDY

Low battery

There are two NMI-interrupt sources in the Tandy WP-2.

1. DC/DC off
2. Low Back-up Battery

DC/DC OFF is a signal for emergency power off. The DC/DC becomes active when the power supply is stopped. When this signal becomes active, register, bank number and interrupt information are saved by software.

Low back-up battery is a signal for back-up battery voltage warning. The low back-up battery signal becomes active when the back-up battery voltage goes down to 2.3V. The low back-up battery signal is maskable by the I/O port 50H.

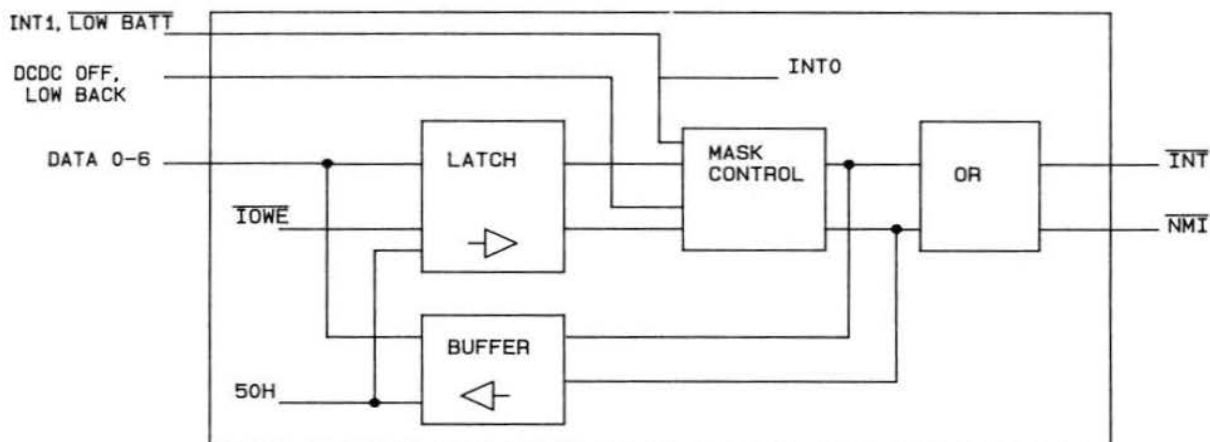

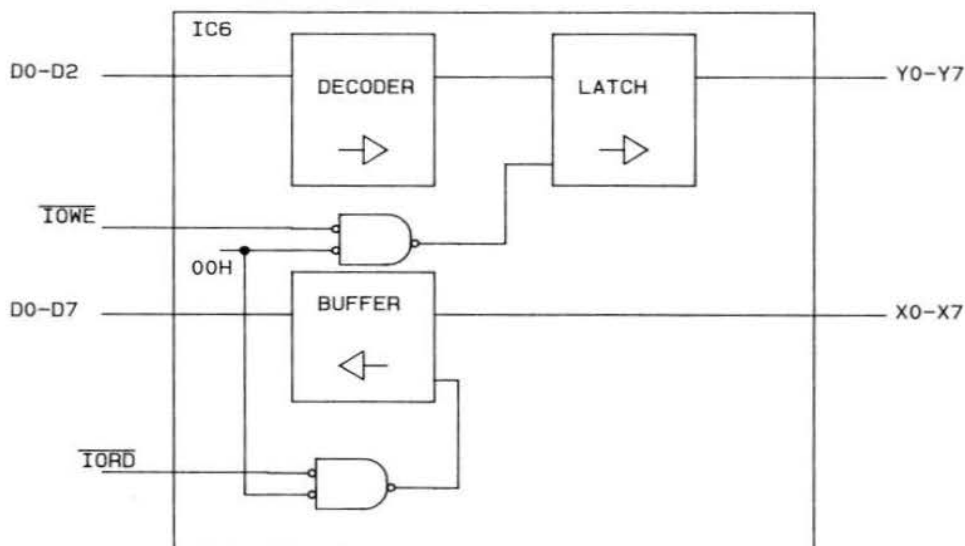

Figure 4-6

IV-10. Keyboard

The Tandy WP-2 uses an internal keyboard.

Key strobe signals are emitted from the Y0-Y7 terminals of IC6. The return signals from the keyboard pass through the X0-X7 terminals of IC6 and are sent to the CPU. Figure 4-7 shows the block diagram in IC6.

IV-11. Cassette Interface Circuit

The cassette interface circuit is subdivided into three sections:

Write Circuit

Transmits data output through the CTD terminal of IC6. The output voltage level is reduced by R14 and R15. The data goes to a cassette recorder's MIC jack. When bit 7 of I/O port 53H is "H", the RXC clock outputs from the CTD terminal.

Read Circuit

The signal input from the earphone jack of the cassette recorder passes through C12, and then is input to the comparator circuit consisting of IC14. The signal is converted into a digital signal and is sent to the CRD terminal of IC6. The control I/O is in bit 0 of 53H.

Remote Circuit

As a result of writing data "1" into bit 0 of I/O port 54H, the CRY signal is changed to H level.

Then, TR2 is switched on and relay RE1 is energized, closing the relay contacts. This causes the drive motor of the cassette recorder to operate.

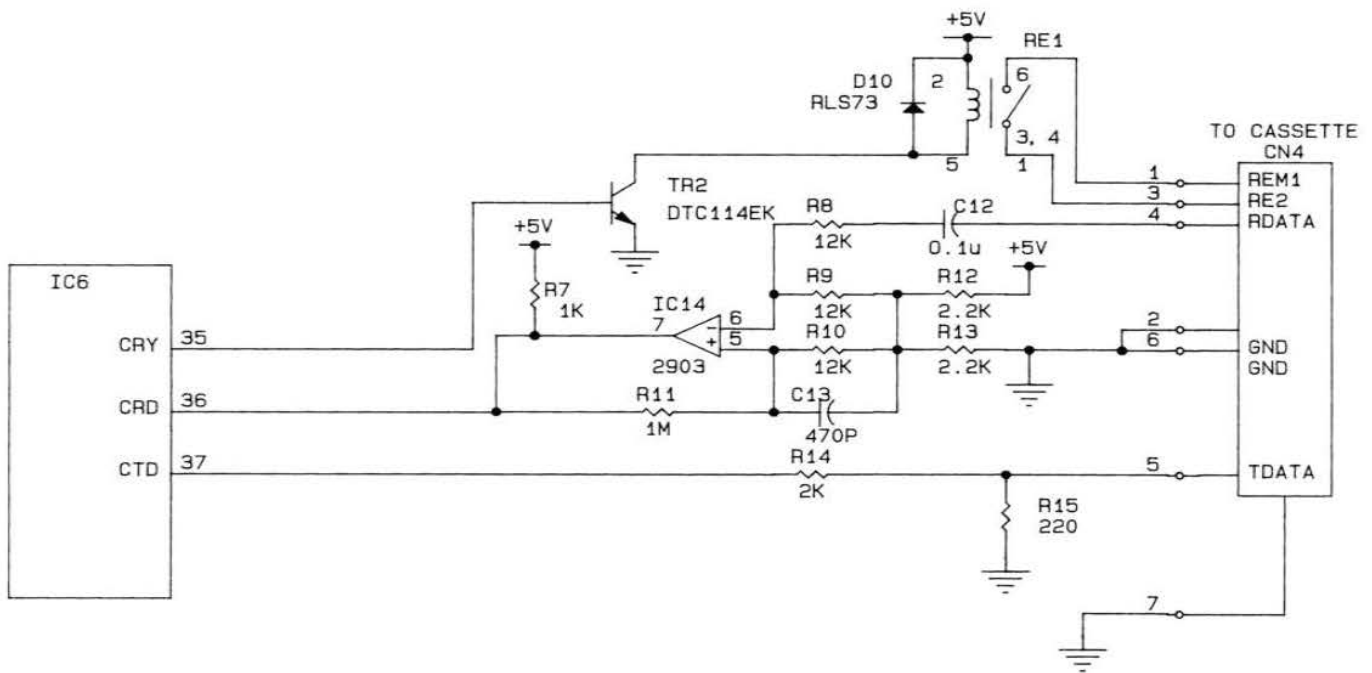

Figure 4-8

IV-12. Printer Interface Circuit

The printer interface circuit conforms to Centronics standards. Figure 4-9 shows the printer interface circuit.

The BUSY signal from the printer is read from the BUSY signal of IC6. If the condition is not busy (BUSY="L"), the 8-bit parallel data is sent to the printer.

As soon as the printer receives the /PSTB signal, the BUSY signal changes to H, indicating that the printer is busy. The CPU then waits for a while until this BUSY signal becomes "L". The printer prints the one character corresponding with the 8-bit parallel data. After completion of the one character printing, the printer sets the BUSY signal to "L". Then, CPU sends the next 8-bit parallel data. If the printer is ON LINE, the /BUSY signal is H and sent to the CPU, passing through the /BSYB signal of IC6. However, when the printer is OFF LINE, the /BUSY signal is L, and transmission of print data to the printer is inhibited by the CPU.

Printer control I/O is in 30H, 31H and 32H.

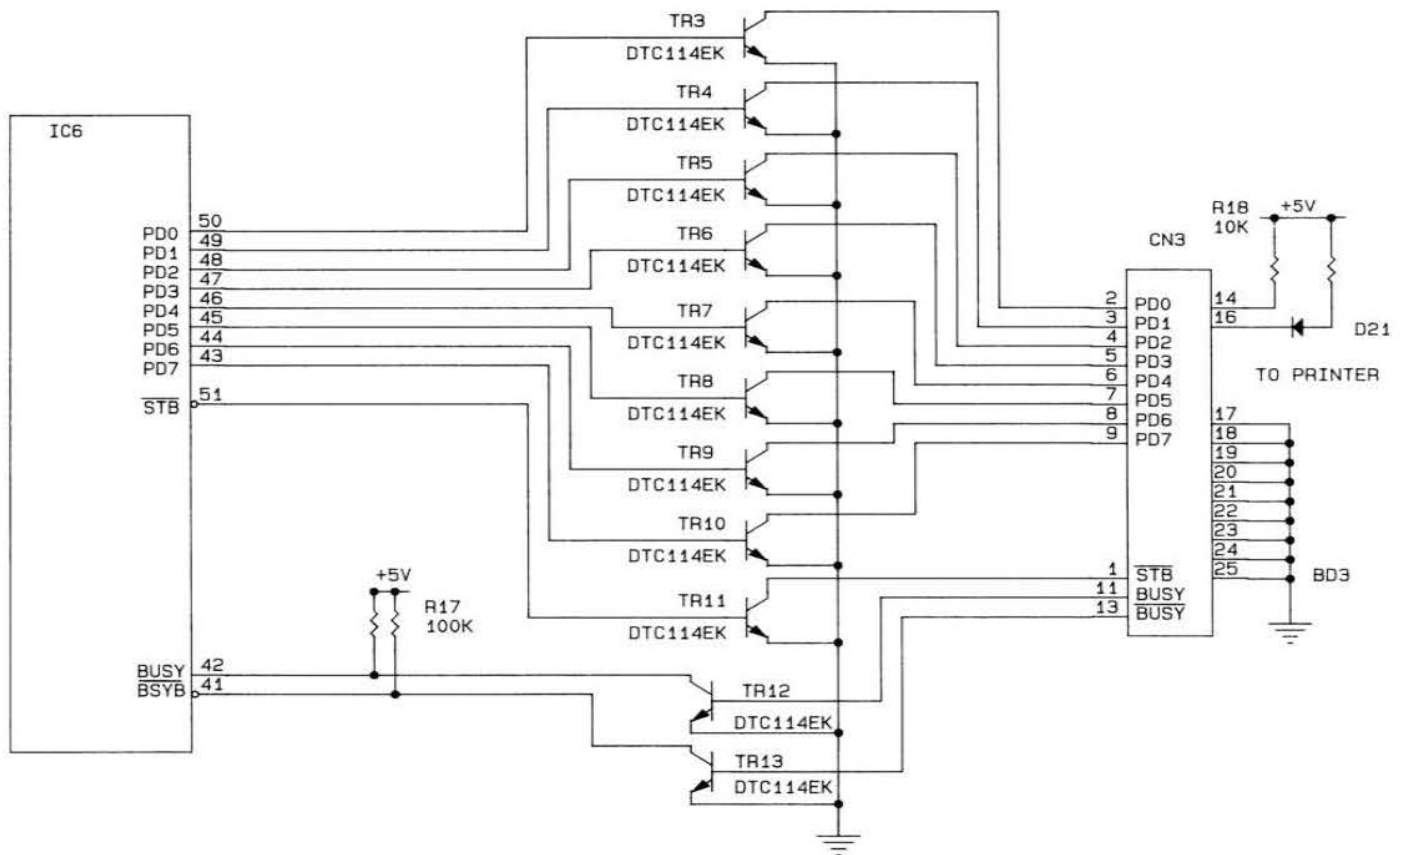

Figure 4-9

IV-13. Serial Interface Circuit

Figure 4-10 shows a block diagram of the serial interface.

Serial data for the Tandy WP-2 is controlled by UART(μ PD71051) and IC5. The UART(IC9) performs serial-to-parallel conversion on data characters received from the CPU. The CPU can read the complete status of the UART at any time during the operation. Status information reported includes the type and condition of the transfer operations being performed by the UART, as well as any error conditions (parity, overrun, or framing).

Figure 4-10 shows the pin layout definitions of UART.

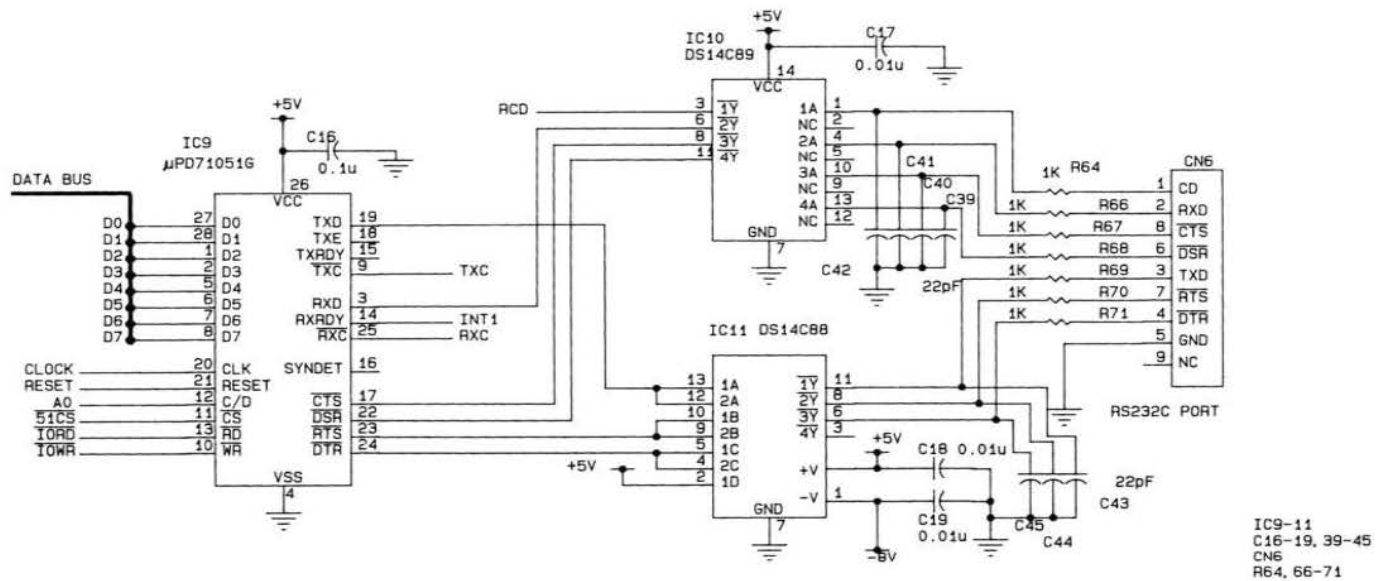

Figure 4-10

IV-14. Buzzer Control Circuit

The system unit has a 12 mm buzzer. The buzzer driver is capable of about 0.1 watts of power. If bit 1 of I/O port 52H becomes "H," then the BEEP of IC6 becomes "H" and the buzzer rings. The buzzer sounds by repeated switching of the buzzer driving transistor. This is caused by H,L,H,L... output signals from the BEEP synchronized with the frequency for sounding the buzzer.

Figure 4-11

IV-15. LCD Controller

CPU interface

The CPU interface circuit of the MSM6255 is shown in Figure 4-12.

Data Bus (D0-D7), Address Bus (A0-A15), /LCDCS, /IORD, /IOWR, and DIEN serve as the interface between the CPU and MSM6255.

When the DIEN signal is "H", LCDC accesses the main RAM. The CPU accesses the main RAM when the DIEN signal is "L."

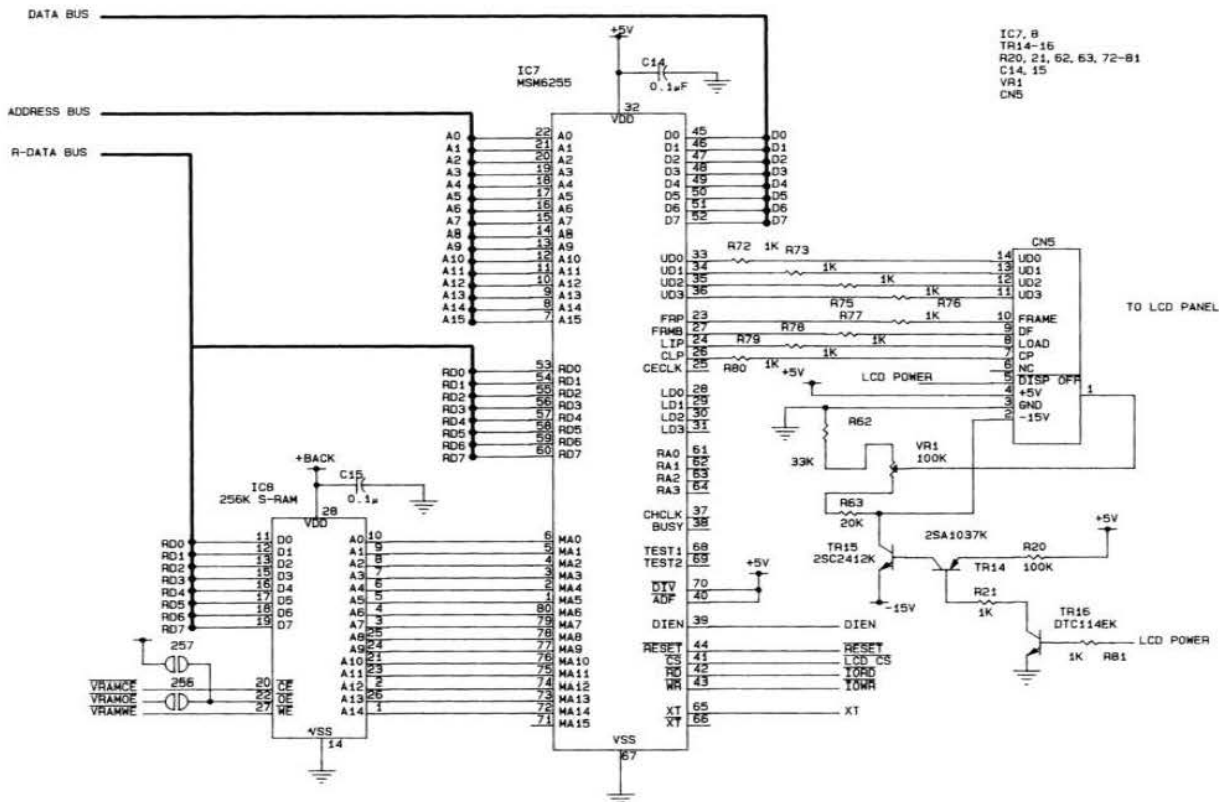

Figure 4-12

IV-16. Power Supply

The system DC power supply has an approximately 1.2 watt, 3 Voltage-level regulator. It is integrated into the system unit, and supplies power for the system unit, and IC Card.

The supply provides 160mA +5VDC $\pm 5\%$, 12mA -8VDC $\pm 10\%$ and 10mA -15VDC $\pm 10\%$ at 6VDC. The system unit takes approximately 50 to 140 mA of +5VDC.

The -8VDC is used for powering the Electronic Industries Association (EIA) drivers for communications in the main PCB. The -15VDC level is used for LCD bias.

+5VDC Output Voltage Circuit

This is a one-transistor self-excited DC/DC converter, which is called R.C.C. (Ringing Choke Converter). Figure 4-13 shows the principle of the circuit.

- When the power is supplied to $V_I(B+)$, Tr turns on and current (I_c) flows through the primary winding of the transformer.
With this current, voltage (V_b) is induced to the base winding, then Tr immediately reaches saturation.
- Tr can no longer maintain saturation. Therefore, Tr is turned off immediately. Then voltage V_o is created by the magnetic energy stored in the transformer, and the voltage is sent to output V_o through the diode D.
- When the energy stored in the transformer is discharged, the output current (I_D) diminishes and reaches zero. However, Tr turns on immediately with the base voltage V_b which is induced from the primary winding, and the above actions are repeated.

The operation of the blocks of the +5V Power Supply circuit is as follows. (Refer to Figure 4-14.)

Block 1 The block operates like a boot-up resistor R_s in Figure 4-13. The block is made of a boot-up circuit, output voltage controller, and shut-down circuit, and the block controls TR30.

Block 2 This switching transistor operates like a transistor in Figure 4-13.

Block 3 This transformer generates +5VDC, -8VDC, and -15VDC output voltages.

Fig. 4-13

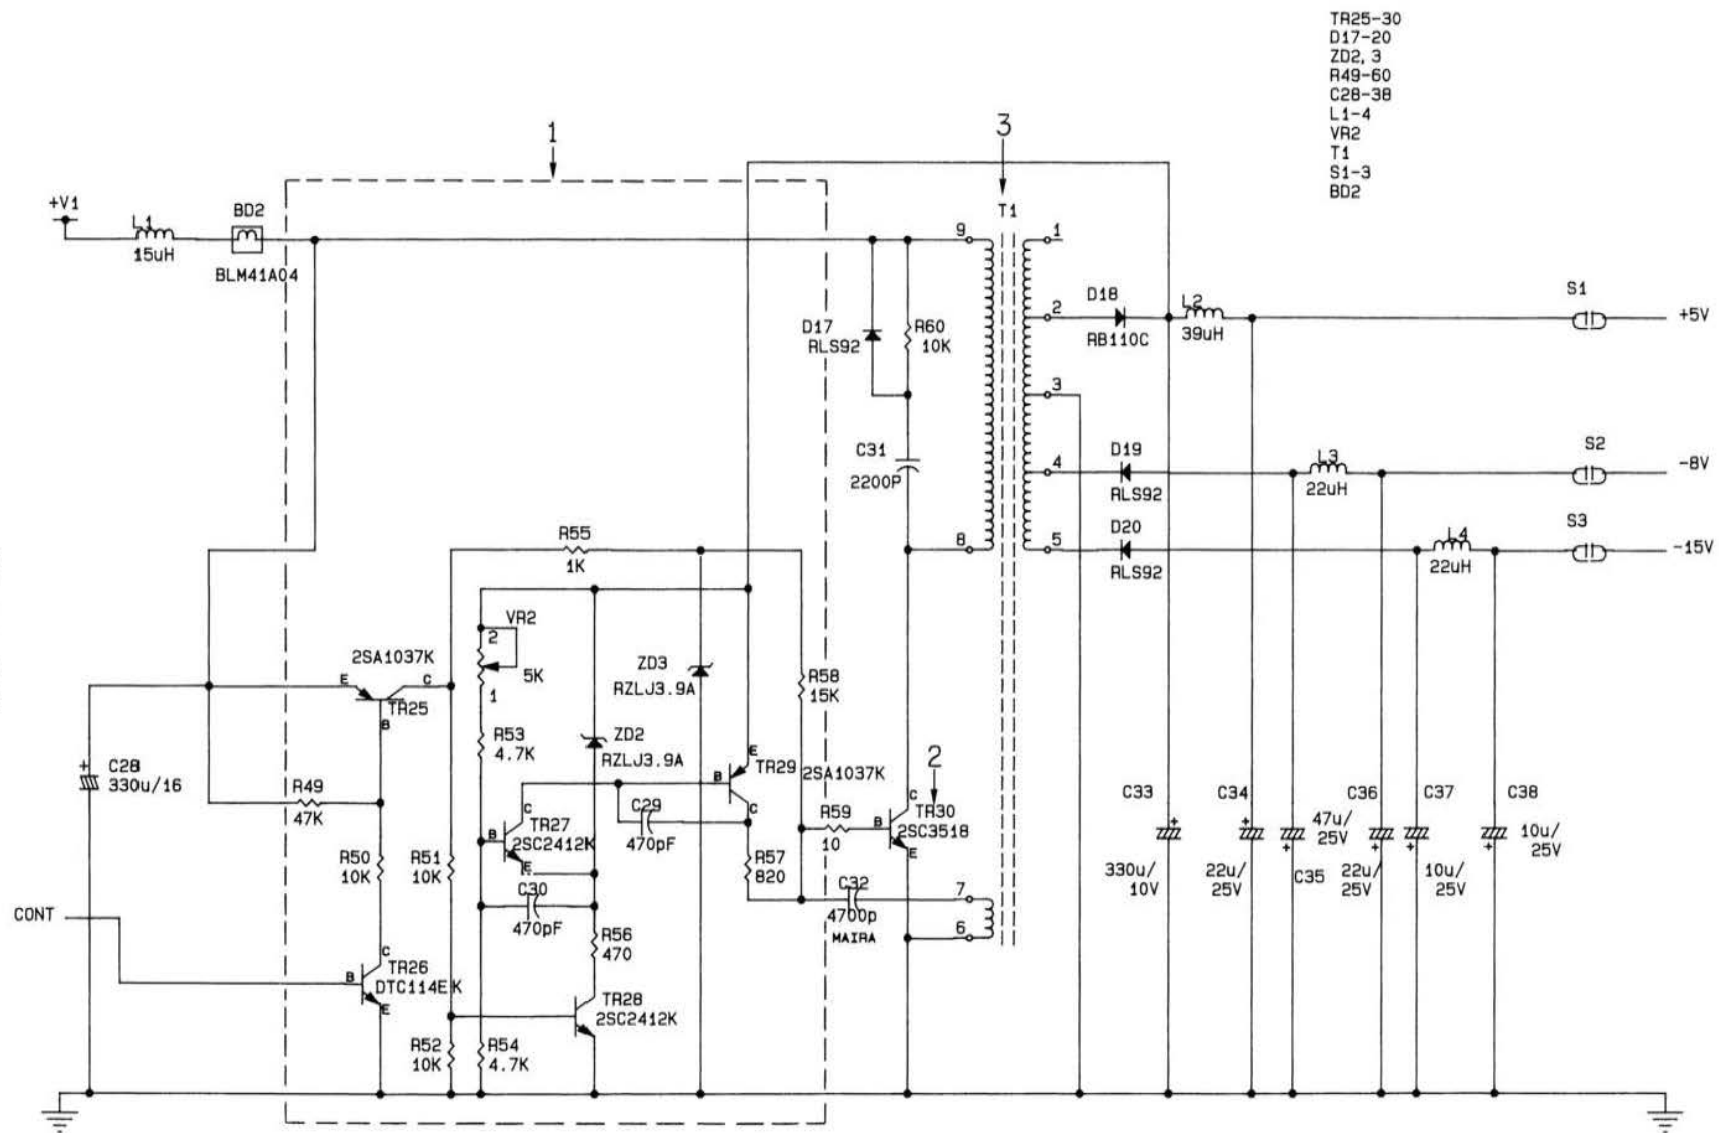

Figure. 4-14

IV-17. Software Calls

Software calls are supplied on MEMORY CARD (ROM IC CARD) or files.

ROM PROGRAMS

The applications on the ROM IC CARD can be executed from WORDPROCESSOR. Execute it by pressing the key combination of 'F2' and '7.' The return to the WORDPROCESSOR is designed by the application side.

RUN FILES

The RUN FILE can be executed from FILES. Execute it by pressing the key combination of 'F2' and '7' after selecting the file. The return to FILES is designed by the application side. This type of application can be kept in memory as a Driver or Filter such as a handler of key scan.

(Sample of program)

This program can execute on the WP-2 system.
--

```
ON-ROM      EQU      0           ; FLAG OF COMPILER

DB           START                             ; ADDRESS OF ENTRY
DW           0                                  ; RESERVED

ELSE                                              ; HEADER OF RUN FILES

ORG          0AC00H-8
DB           'PR'                               ; ID
DW           PRGEND-PRGTOP+1                    ; SIZE OF PROGRAM
DW           START                             ; ADDRESS OF ENTRY
DW           0                                  ; LOCATED ADDRESS (HERE IS 0)
```

The WP-2 cannot handle a RUN FILE unless it has an identification header. The format for this ID header is as shown in the sample program above. The LOCATED ADDRESS in the ID header is "0000H." The WP-2 reads the main part of a program following the ID header into the area beginning at "AC00H" and places the control on the address designated as the ADDRESS OF ENTRY.

There are times when a loaded RUN FILE reads SUB RUN FILES and allows them to run. The LOCATED ADDRESS and ADDRESS OF ENTRY in a SUB RUN FILE's ID header are determined by the root RUN FILE and are registered accordingly. The contents of the ID header for the SUB RUN FILES are different from those of a root RUN FILE. The WP-2 handles only certain RUN FILES; therefore, a user cannot execute a SUB RUN FILE without a root RUN FILE. Also, the WP-2 does not have a program loader for SUB RUN FILES; the root RUN FILE must have a program loader.

```

ENDIF

PRGTOP:                                ; TOP OF PROGRAM
START:                                ; PROGRAM BEGINS FROM HERE
        CALL        CLS                ; CLEAR THE SCREEN
        CALL        GETCH              ; GET THE DATA FROM CONSOLE
        LD          A,H

        BIT         0,L                ; IF 'EXIT' KEYS ARE PRESSED,
        JR          Z,DISPLAY          ; RETURN TO WP-2 SYSTEM.
        CP          BKSP

IF ON-ROM
        RET         Z
ELSE
        XOR         A                  ; RETURN WITH FLAG
        RET
ENDIF

```

The RETURN WITH FLAG means that program area is returned to the system. If it needs to keep the program as a Driver or Filter, register "A" must be set to FF.

```

DISPLAY:
        CALL        PUTCH              ; INDICATE ONE CHARACTER
        JR          START              ; TRY AGAIN.

PRGEND:                                ; END OF PROGRAM

```

END

You can get the hex file to compile the source program such as the one shown above. However, you need to record the program into a ROM or RAM IC CARD for the WP-2 to operate it. If the program is a ROM APPLICATION, you burn the program into the ROM. If the program is a RUN FILE, it is better if you transfer the program through XMODEM. Of course, you must convert the file to binary data.

IV-18. Software and Hardware Memory Map

MEMORY MAP

The RAM DISK is assigned to the I/O port from bank 0 to bank 3. The MEMORY CARD is assigned to the I/O port from bank 4 to bank 7. Each bank begins at address 8000, and ends at address FFFF.

All system's applications are included in the MAIN ROM. It begins at address 0000 in bank 0, and ends at address 7FFF in bank 14. From bank 15 to bank 30 is the area of IC card ROM APPLICATIONS. Bank control I/O is in port 51H.

DETAILS OF PROGRAM

Bank	Address	Contents
[ROM] : body of programs		
0	0000-23FF	BIOS jump table, and program of BIOS
0	2400-2BFF	Character font set
0	2C00-2FFF	Interface of function of dictionary, and handler
0	3000-	WORDPROCESSOR
1	-73FF	
1	7400-	Dictionary
14	-7FFF	
[RAM] : work area		
—	8000-833F(+512+320)	SPELLER work area
—	8340-8344	Hook table of SPELLER
—	8345	Hook table for TIMER interrupt
—	8348	for key scan into timer int.
—	834B	for character out to console
—	834E	for debugger
—	8351	for external interrupt
—	8354	for RS-232C receive interrupt
—	8357-98FF	BIOS work area Editor (word processor) work area
	8357	Cursor's line (Y) position
	8358	Cursor's column (X) position
	835A	Pointer to store the key code
	835C	Pointer to get the code from buffer

		First byte (status bit)
		bit 0 : F2 key status
		bit 1 : F1 key
		bit 2 : Ctrl key
		bit 3 : Shift (right) key
		bit 4 : Shift (left) key
		bit 5 : Caps lock On/Off
		bit 6 : 0:GRPH/1:CODE mode
		bit 7 : 0:Normal/1:above mode
		Second byte (data)
		Data of key code. If mode is GRPH or CODE, this data is added at 20H.
	83FF	Value of counting the timer int.
	8403	Console controller status
		bit 0 : cursor brink ON/OFF
		bit 1 : type of cursor
		bit 2 : brink Enable/Disable
		bit 3 : character attribute
	840D	Pointer to store the receive data
	840F	Pointer to get the data from buffer
	8411-8510	Receive data buffer
		First byte (status bit)
		bit 0 : Flag, 0:no data/1:data

bit 5 : Flaming error
bit 6 : Overrun error
bit 7 : Parity check error
Second byte (data)
Receive Data

—	9900-A7FF	LCD (VRAM area)
—	A800-ABFF	Stack area
—	AC00-FFFF	APPLICATION work area (Data of document, file or paste buffer)

HANDLER OF TIMER INTERRUPT

To handle the TIMER interrupt, the following must be done.

- 1) Refer to hook table of timer interrupt.
- 2) Initialize the TIMER device.
- 3) Power Switch status is checked and handled.
- 4) Control the LOW BATTERY indication.
- 5) Control the LOW BACK UP indication.
- 6) Auto Power Off control
- 7) Refer to hook table of key scan.
- 8) Handle the key scan.

If you want to change the Key Scan Handler of the WP-2 to another handler, you need to design the other Key Scan Handler as a RUN FILE PROGRAM. The initialize routine must rewrite the hook table to hook the other handler; that is, the entry address of the handler is written from the second byte in the hook table, and the instruction code for jump command is written into the first byte. The instruction 'POP' must be included in the handler routine as a dummy to ignore the handler of the WP-2.

HOOK TABLE OF DEBUGGER

To refer the hook table of the Debugger, execute the instruction 'RST 28H'. It will be used by the BREAK function to set the instruction 'RST 28H' to the address of the break pointer.

APPENDICIES

A. LCD SPECIFICATIONS

1. Application

These specifications shall be applied to Dot Matrix LCD MODULE H4060H-YR.

2. Composition

Display type : STN, yellow mode, reflective positive display
Dot structure : 480 × 64 Dot Graphic display
Driving method : 1/64 duty Multiplex drive
Connector : IL-FPC-14S-S1L1 (JAE)

Block Diagram

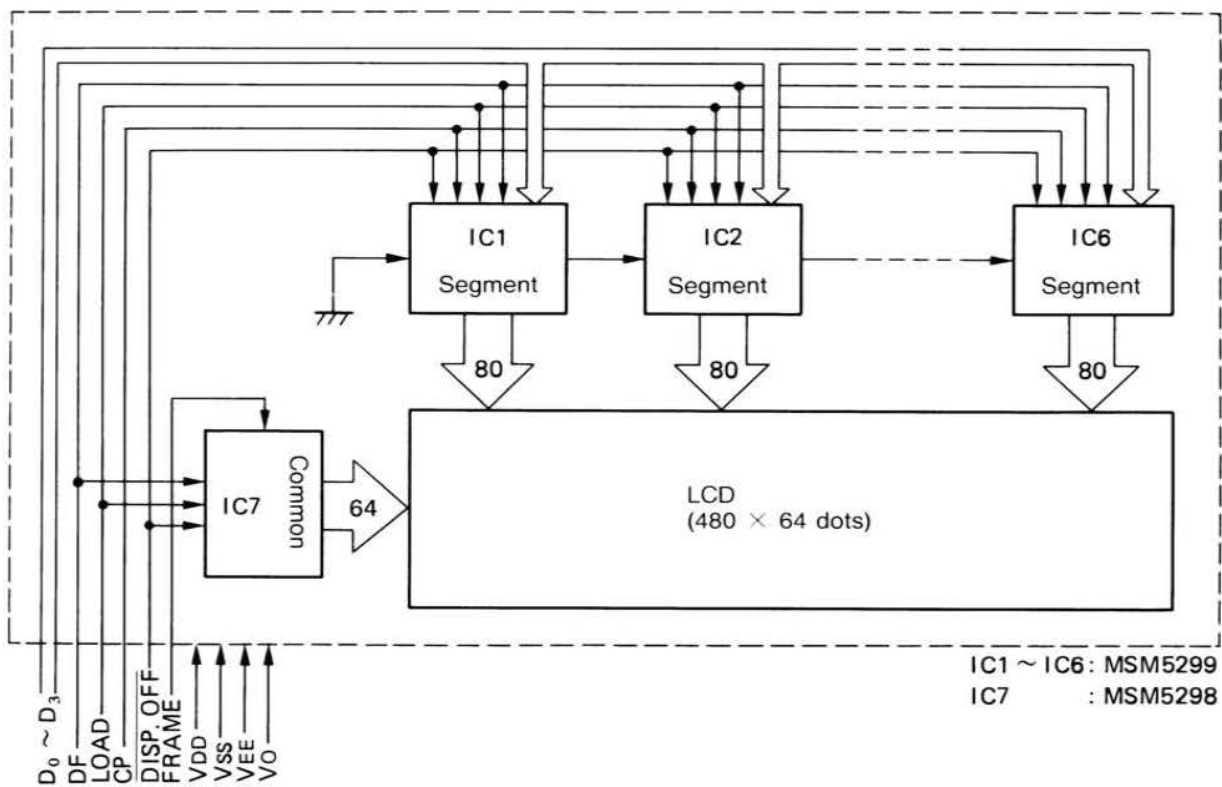

Figure A-1. Block Diagram

Note: This does not incorporate any controller.

3. Mechanical Specifications

Item	Dimensions	Unit
Module size	260 (W) × 52 (H) × 9.5 (D) max	mm
Effective viewing area	218 (W) × 36 (H)	mm
Weight	Approx. 150	g

Note: Module size [9.5 (D) max] does not include the connector.

Dot Dimensional Drawing (Unit mm)

Figure A-2. Dot Dimensional Drawing

4. Electrical Specifications

4-1. Absolute Maximum Ratings

Item	Symbol	Min	Max	Unit	Remarks
Supply voltage for logic circuit	$V_{DD} - V_{SS}$	-0.3	+6.0	V	
Supply voltage for LCD driving	$V_{DD} - V_{EE}$	0	+30.0	V	
Input voltage	V_{IN}	-0.3	$V_{DD} + 0.3$	V	
Storage temperature	T_{stg}	-20	+60	°C	
Operating temperature	T_{opr}	0	+40	°C	

4-2. Electrical Characteristics

Item	Symbol	Test condition	Min	Typ	Max	Unit
Supply voltage for logic circuit	$V_{DD} - V_{SS}$		4.5	5.0	5.5	V
Supply voltage for LCD driving	$V_{DD} - V_{EE}$		9.0	—	28.0	V
FRAME frequency	f_{FRAME}		—	70.0	—	Hz
Input voltage	H level	$V_{DD} - V_{SS} = 5.0V \pm 10\%$	$0.8V_{DD}$	—	V_{DD}	V
	L level		V_{SS}	—	$0.2V_{DD}$	V
Current consumption	I_{SS}	$T_a = 25^\circ C$ $V_{DD} - V_{SS} = 5.0V$ $V_{DD} - V_{EE} = 14.3V$	—	0.5	2.4	mA
	I_{EE}	$V_O = V_{EE}$ $f_{FRAME} = 70 \text{ Hz}$	—	2.3	4.7	mA

$$* V_{DD} > V_{SS} > V_O \geq V_{EE}$$

4-3. Operating voltage for LCD driving

The contrast of the liquid crystal display depends on viewing angle, ambient temperature, and operating voltage, etc. Adjust the contrast by varying V_O as necessary.

The following values are recommended.

$T_a = 0^\circ C$	15.5Vtyp
$T_a = 25^\circ C$	14.3Vtyp
$T_a = 40^\circ C$	13.7Vtyp

$$0 = 0^\circ, \theta = 0^\circ$$

4-4. Vo adjusting circuit

Figure A-3. Vo Adjusting Circuit

5. Interface Specifications

5-1. Terminal Pin Assignment

Pin No.	Symbol	Function
1	V _O	Operating Voltage for LCD driving
2	V _{EE}	Supply Voltage for LCD driving
3	V _{SS}	GND
4	V _{DD}	+5V (Supply voltage for logic circuit)
5	DISP. OFF	Low level : LCD becomes non-visual. Hi level : LCD operates normally.
6	NC (FG)	No connection
7	CP	Shift register clock pulse for segment driver
8	LOAD	Signal for latching 1 line shift register
9	DF	A.C. signal for LCD driving
10	FRAME	Start signal of each display cycle (Shift register DATA signal of common driver)
11 - 14	D3 - D0	DATA Input signal (Fig. A-4)

5-2. Relationships of DATA Input Signal and LCD Screen Division

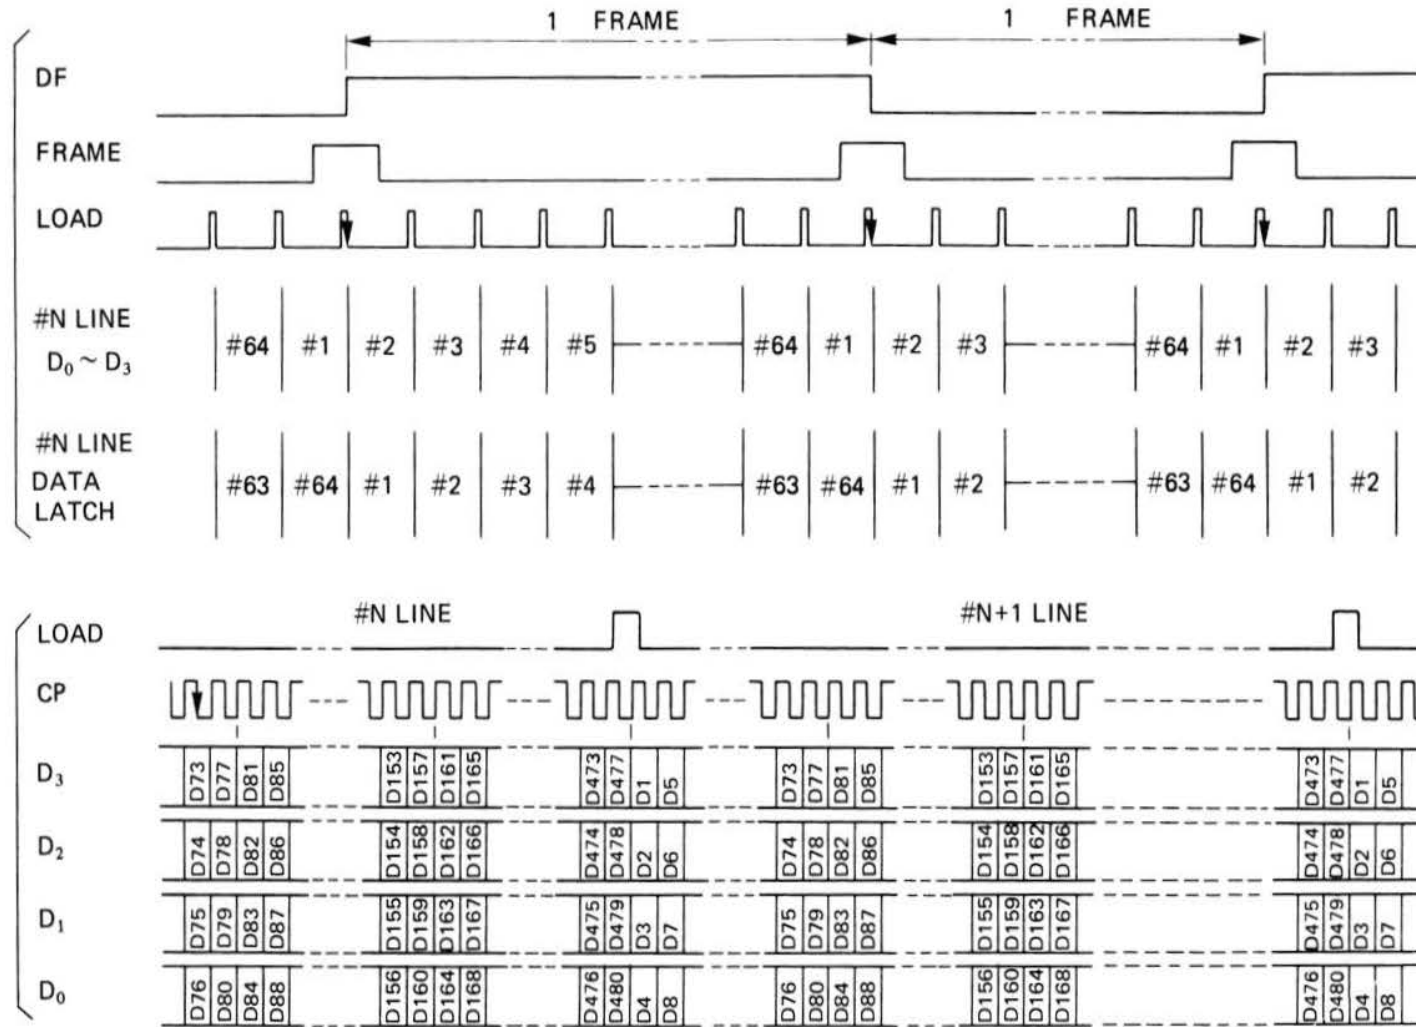

Figure A-4. LCD Screen

H4061H-PR

Refer to fig 5-1

Figure A-5. Timing Chart

5-4. Switching Characteristics

$V_{DD} = 5V \pm 10\%$

Item	Symbol	Condition	Min	Typ	Max	Unit
CP frequency	f_{CP}	DUTY = 50%	—	—	3	MHz
CP LOAD pulse width	t_w	—	125	—	—	ns
DATA SET UP TIME D0 – D3 → CP	t_{OSU}	—	100	—	—	ns
LOAD SET UP TIME	t_{LSU}	—	125	—	—	ns
LOAD ↔ CP TIME	t_{LC}, t_a	—	200	—	—	ns
DATA HOLD TIME CP → D0 – D3	t_{DHD}	—	100	—	—	ns
LOAD → FRAME TIME	t_{LF}	—	300	—	—	ns
FRAME → LOAD TIME	t_{FL}	—	300	—	—	ns
FRAME SET UP TIME FRAME → LOAD	$t_{setup} (FR)$	—	100	—	—	ns
FRAME HOLD TIME LOAD → FRAME	$t_{hold} (FR)$	—	100	—	—	ns
LOAD ↔ DF DELAY TIME	t_{LD}	—	—	—	300	ns
CP RISE & FALL TIME	$t_{r(CP)}$ $t_{f(CP)}$	—	—	—50	ns	
LOAD RISE & FALL TIME	$t_{r(L)}$ $t_{f(L)}$	—	—	—	50	ns
DF RISE & FALL TIME	$t_{r(DF)}$ $t_{f(DF)}$	—	—	—	100	ns

5-5. Input Capacitance

Signal	Input Capacitance	Unit
FRAME	15 Typ	pF
DF	40 Typ	pF
LOAD	45 Typ	pF
CP	35 Typ	pF
D3 – D0	35 Typ	pF

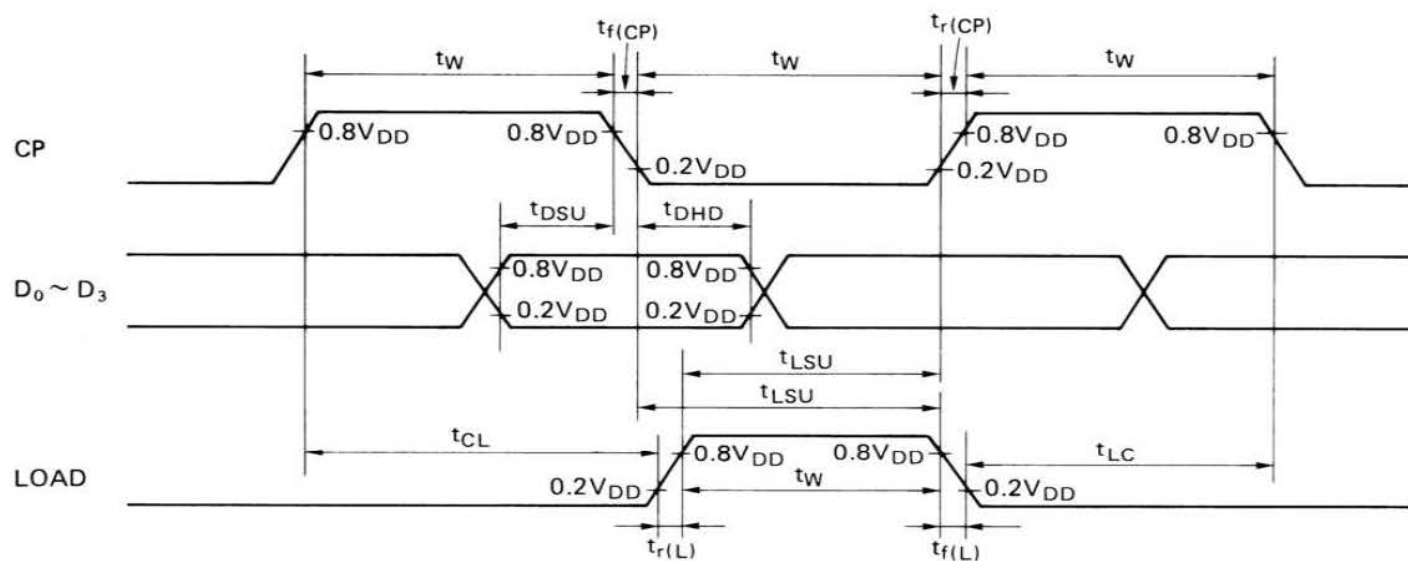

Figure A-6. Timing Chart

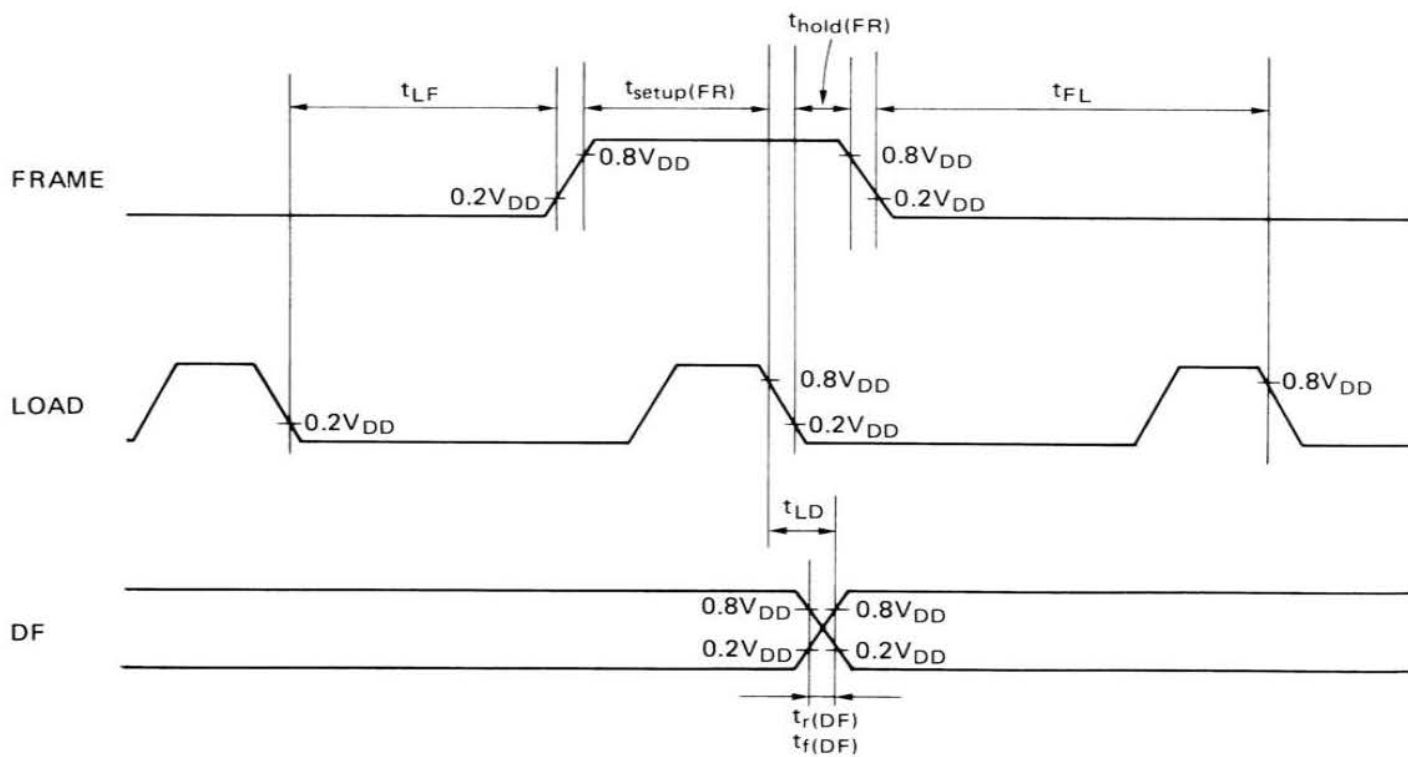

Figure A-7. Timing Chart

6. Optical Characteristics (refer to Note 1 – Note 4)

Ta = 25°C

Item	Symbol	Min	Typ	Max	Unit	Condition
Turn on time	t _{ON}	—	150	270	ms	$\theta=0^{\circ}, \phi=0^{\circ}$
Turn off time	t _{OFF}	—	200	360	ms	
Contrast ratio	CR	—		—		$\theta=0^{\circ}, \phi=0^{\circ}$
Visual angle range	$\theta 1$		$\leq \theta 1 \leq$		deg.	$\theta=0^{\circ}, CR \geq 1.4$
	$\theta 2$		$\leq \theta 2 \leq$		deg.	$\theta=90^{\circ}, CR \geq 1.4$

Note 1: Optical Characteristics measurement system

Figure A-8. Optical Characteristics Measurement System

Note 2: Definition of response time

Figure A-9. Definition of Response Time

Note 3: Definition of θ and ϕ

Figure A-10. Definition of θ and ϕ

Note 4: Definition of contrast ratio

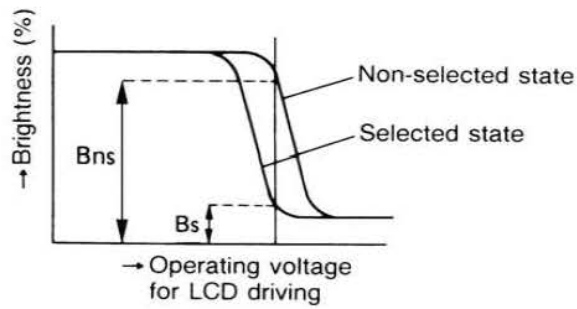

Figure A-11. Definition of Contrast Ratio

$$CR = \frac{\text{Brightness at selected state (Bs)}}{\text{Brightness at non-selected state (Bns)}}$$

7. Precautions in Use

7-1. Precautions for handling

- (1) The polarizer is quite susceptible to scratches. Handle it very carefully. Do not handle it with metallic tweezers. Do not press it or rub it.
- (2) Do not touch the display face or stain it.
If the surface is dirty, wipe it off lightly with a cotton swab or a piece of soft cloth or chamois which is soaked with petroleum or benzine. Never use organic solvents including acetone, toluene, ethanol, and isopropyl alcohol: they would damage the surface.
- (3) Do not allow saliva or water to remain on the surface for long; it might cause a local deformation or discoloration.
- (4) If the LCD breaks and the liquid crystal comes out, never put it in your mouth. If it sticks to the skin or clothes, wash it off with soap immediately.

7-2. Installation

- (1) The ICs mounted on the PCB are very susceptible to static electricity. To protect them from static electricity which your body and clothing collect, connect your body to ground via a resistor of some 1M ohms to discharge electricity. Connect the resistor close to your body in the grounding line and protect yourself from electric shock hazard.
- (2) Do not bend or twist the module excessively when installing it. If you do, the device might break or the circuits might fail.
- (3) Protect the LCD, particularly the surface of the polarizer, with a transparent plate (such as an acrylic or glass plate) on the cabinet.

7-3. Storage

- (1) Avoid high temperature and high humidity. The temperature should be 0 – 35°C and humidity under 60%.
- (2) Store the module in a dark place, out of direct sunlight and fluorescent light, etc.
- (3) Keep the polarizer away from any external forces.
- (4) Store the module in the box when shipping it.

7-4. Operational precautions

- (1) The ICs will break down if the drive voltage exceeds the limit. Make sure of electrical specifications, particularly the supply voltage.
- (2) The response of the display is slow when the ambient temperature is below the lower limit, and the display becomes unusual when the ambient temperature is above the upper limit. In any case, it does not mean failure. It operates properly in the normal operating temperature range.
- (3) The contrast of the liquid crystal varies with the viewing angle, ambient temperature, and drive voltage. Adjust the drive voltage for the best contrast by installing an external variable switch.
- (4) If you move the module from cold storage into a room, as during a test, moisture would condense on the module and it might fail.
- (5) In order to prevent IC Latch-up and DC voltage on the LCD panel, turn power on by following Figure A-12.

Note: FRAME frequency = 70 Hz

Note: FRAME frequency = 70 Hz

Figure A-12. Operational Precautions

8. LCD Module View

B. INSTALLATION OF OPTIONAL RAM

1. Turn off the back-up battery switch.
2. Remove 5 screws "A" from the lower case.
Refer to Figure 2-3. Top Case Removal
3. Remove the upper case.
The upper and lower cases are secured by snaps. Pull up the front of the upper case first, as shown in Figure 2-1.
Do not apply too much force when pulling it.
4. Disconnect the LCD flat cable from the connector on the main PCB.
Refer to Figure 2-4. LCD Cable Removal.
5. Insert the optional RAM into the IC socket marked IS1.
Refer to Figure B-1. RAM Insertion.
6. Press [F2]-[Ctrl]-[Bs] or Reset Switch (SW2) after power on.

ENTRY:	0170H
ENTER:	HL =char fname[12]
EXIT:	Carry Flag set =error
	Carry Flag reset =no error
	HL =pointer to returned block
	DE =length of the block (32 bytes)

You can get a memory block by using this function.
When HL equals 0 , you can get all free blocks in RAM.

NOTE: This fname is not a string but a block. It is not null (0) terminated. An example of fname is:

	123456789012
; db	'foo .bar'

Following is an example of the internal state:

REGISTERS PRESERVED	IX,IY AF',BC',DE',HL'

2. SPELLER INFORMATION

The speller/thesaurus code contains a single entry point at hex 2C00. This software hook is from 2C00H to 2C1FH. The function to be executed is contained in the A register. The speller/thesaurus code sets the correct program/data base bank and performs the desired function.

Note: No registers are preserved by the speller/thesaurus module. To be safe, assume all registers (of the current register bank) are destroyed by call.

User Dictionary

This dictionary is user-defined and implemented. The spelling corrector does not reference the user dictionary.

Operations

The A register contains the function code. The chart below details any other required data. All strings should be null (0) terminated.

Code	Input	Function	Outputs
1	A=2 (H, L) = string addr.	Spell String	C=1 if OK =0 if misspelled
2	A=3 (H, L) = string addr.	Single Char. Corrections	C=1 if alternates (H,L)=ptr to 1st Alt. A= # of alternates
3	A=4 (H, L) = string addr.	Phonetic Corrections	C=1 if alternates (H,L)=ptr to phonetic Alt. A= # of alternates
4	A=10	Find Synonyms	C=1 if more synonyms C=0 if only one synonym (H,L)=ptr to 1st syn. A= # of synonyms in this row B=0 (noun) 1 (verb) 2 (adjective) 3 (adverb) 4 (preposition) 7 (conjunction)
5	A=11	Next Syn. Row	C=0 if no more rows C=1 if more rows exist (H,L) =addr. of 1st syn. on a row B=0 (noun) 1 (verb) 2 (adjective) 3 (adverb) 4 (preposition) 7 (conjunction)
6	A=12	Previous Syn.	C=0 if at top C=1 if there's a row above (H,L) =addr. of syn. on a row A= # syns in this row B=0 (noun) 1 (verb) 2 (adjective) 3 (adverb) 4 (preposition) 7 (conjunction)

Note: Single Character Correction

This routine would take care of alternates allowing single character rules to get

(1) DELETED (2) TRANSPOSED (3) INSERTED (4) REPLACED.

The organization of the synonyms is as follows:

<Main Syn 1> <Next Main Syn 1> <alt syn 11> <alt syn 12> ... <alt syn 1N[1]>
<Main Syn 2> <Next Main Syn 2> <alt syn 21> <alt syn 22> ... <alt syn 2N[2]>
.
.
.
<Main Syn m> <Next Main Syn m> <alt syn m1> <alt syn m2> ... <alt syn mN[n]>

where N[1], N[2], ... N[n] are the lengths of row 1, row 2 and row n, respectively, and m is the number of rows. Note that each row can have a different number of synonyms. The first two synonyms on a row contain the most "popular" alternate meanings of the root word. The rest of the list contains more esoteric definitions.

A call to Find Synonyms returns in the A register the number of synonyms in the first row. The (H,L) points to the first string of the row. Each string is null terminated.

The locations for the counts and the quit alternate flags are as follows:

Single character correction (function 3) 8325H
Phonetic corrections (function 4) 8326H
Quit corrections 8327H

When the Corrections are in progress and the byte 0FFH is written to quit corrections (location 8327H), then the correction function 3 or 4 returns.

String Format

All strings are returned in the following format:

<string 1> <0> <string 2> <0> ... <string n> <0>

The A register contains the total number of strings that the (H,L) register pair points to.
